

Turbulence Classification

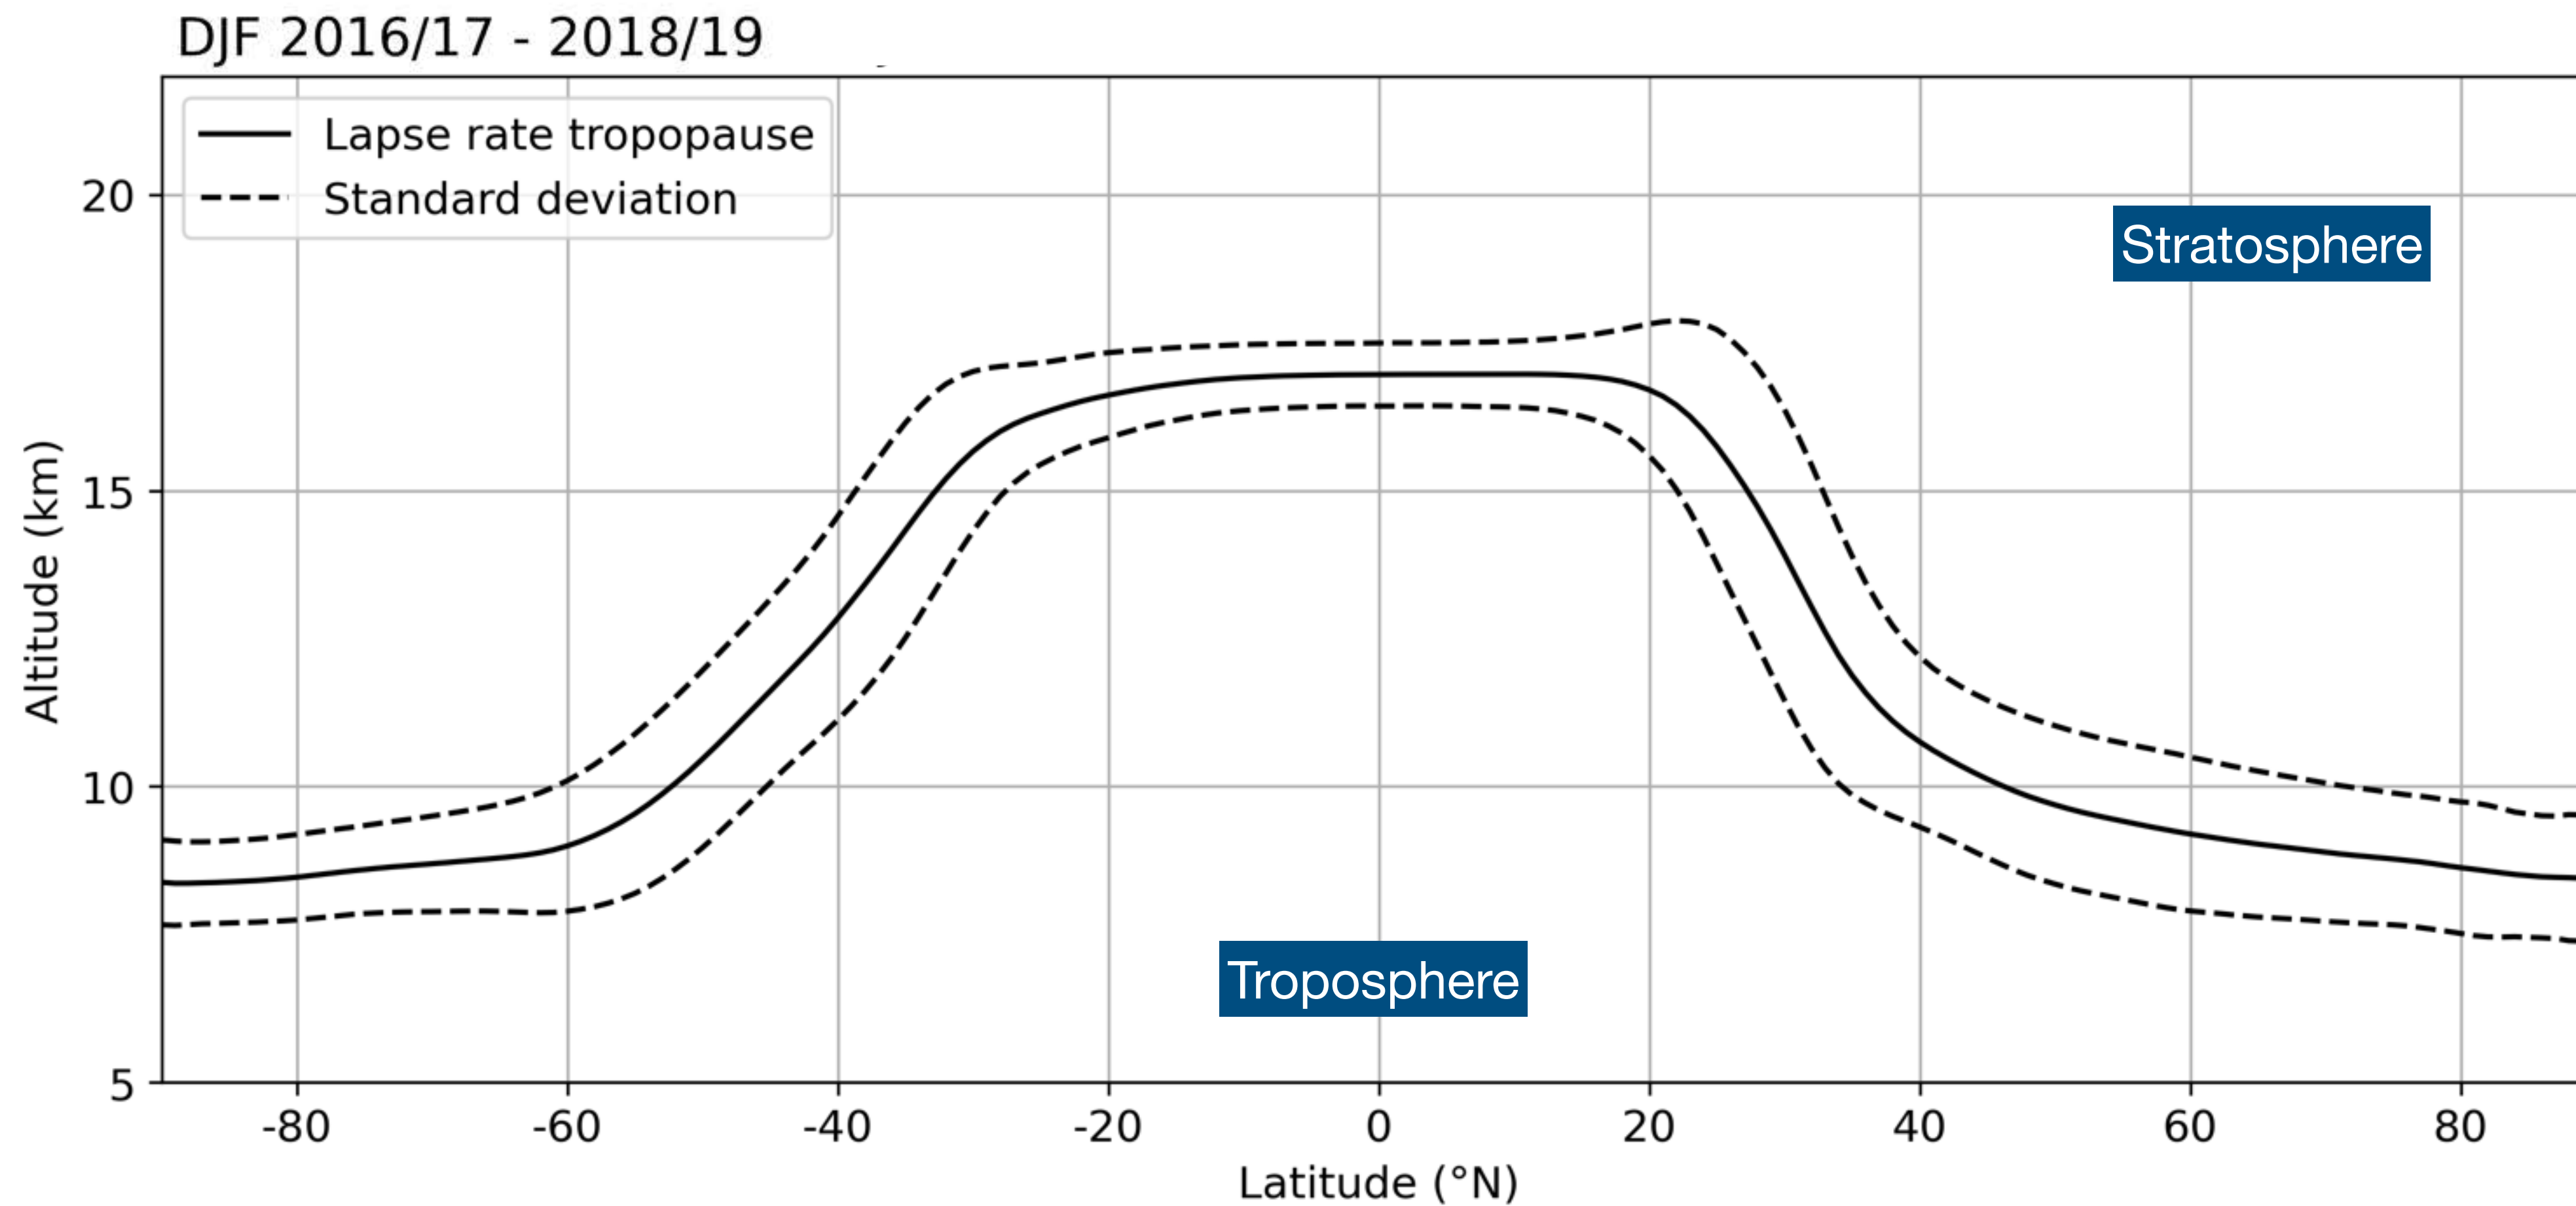

In the extratropical UTLS, using:

- automated EDR reports
- ERA5 diagnostics
- a random forest classifier

FISAPS Workshop
30 August - 1 September 2023
NCAR, Boulder Colorado

Thorsten Kaluza, Peter Hoor, Daniel Kunkel

Motivation: UTLs

Motivation: Trace gas gradients

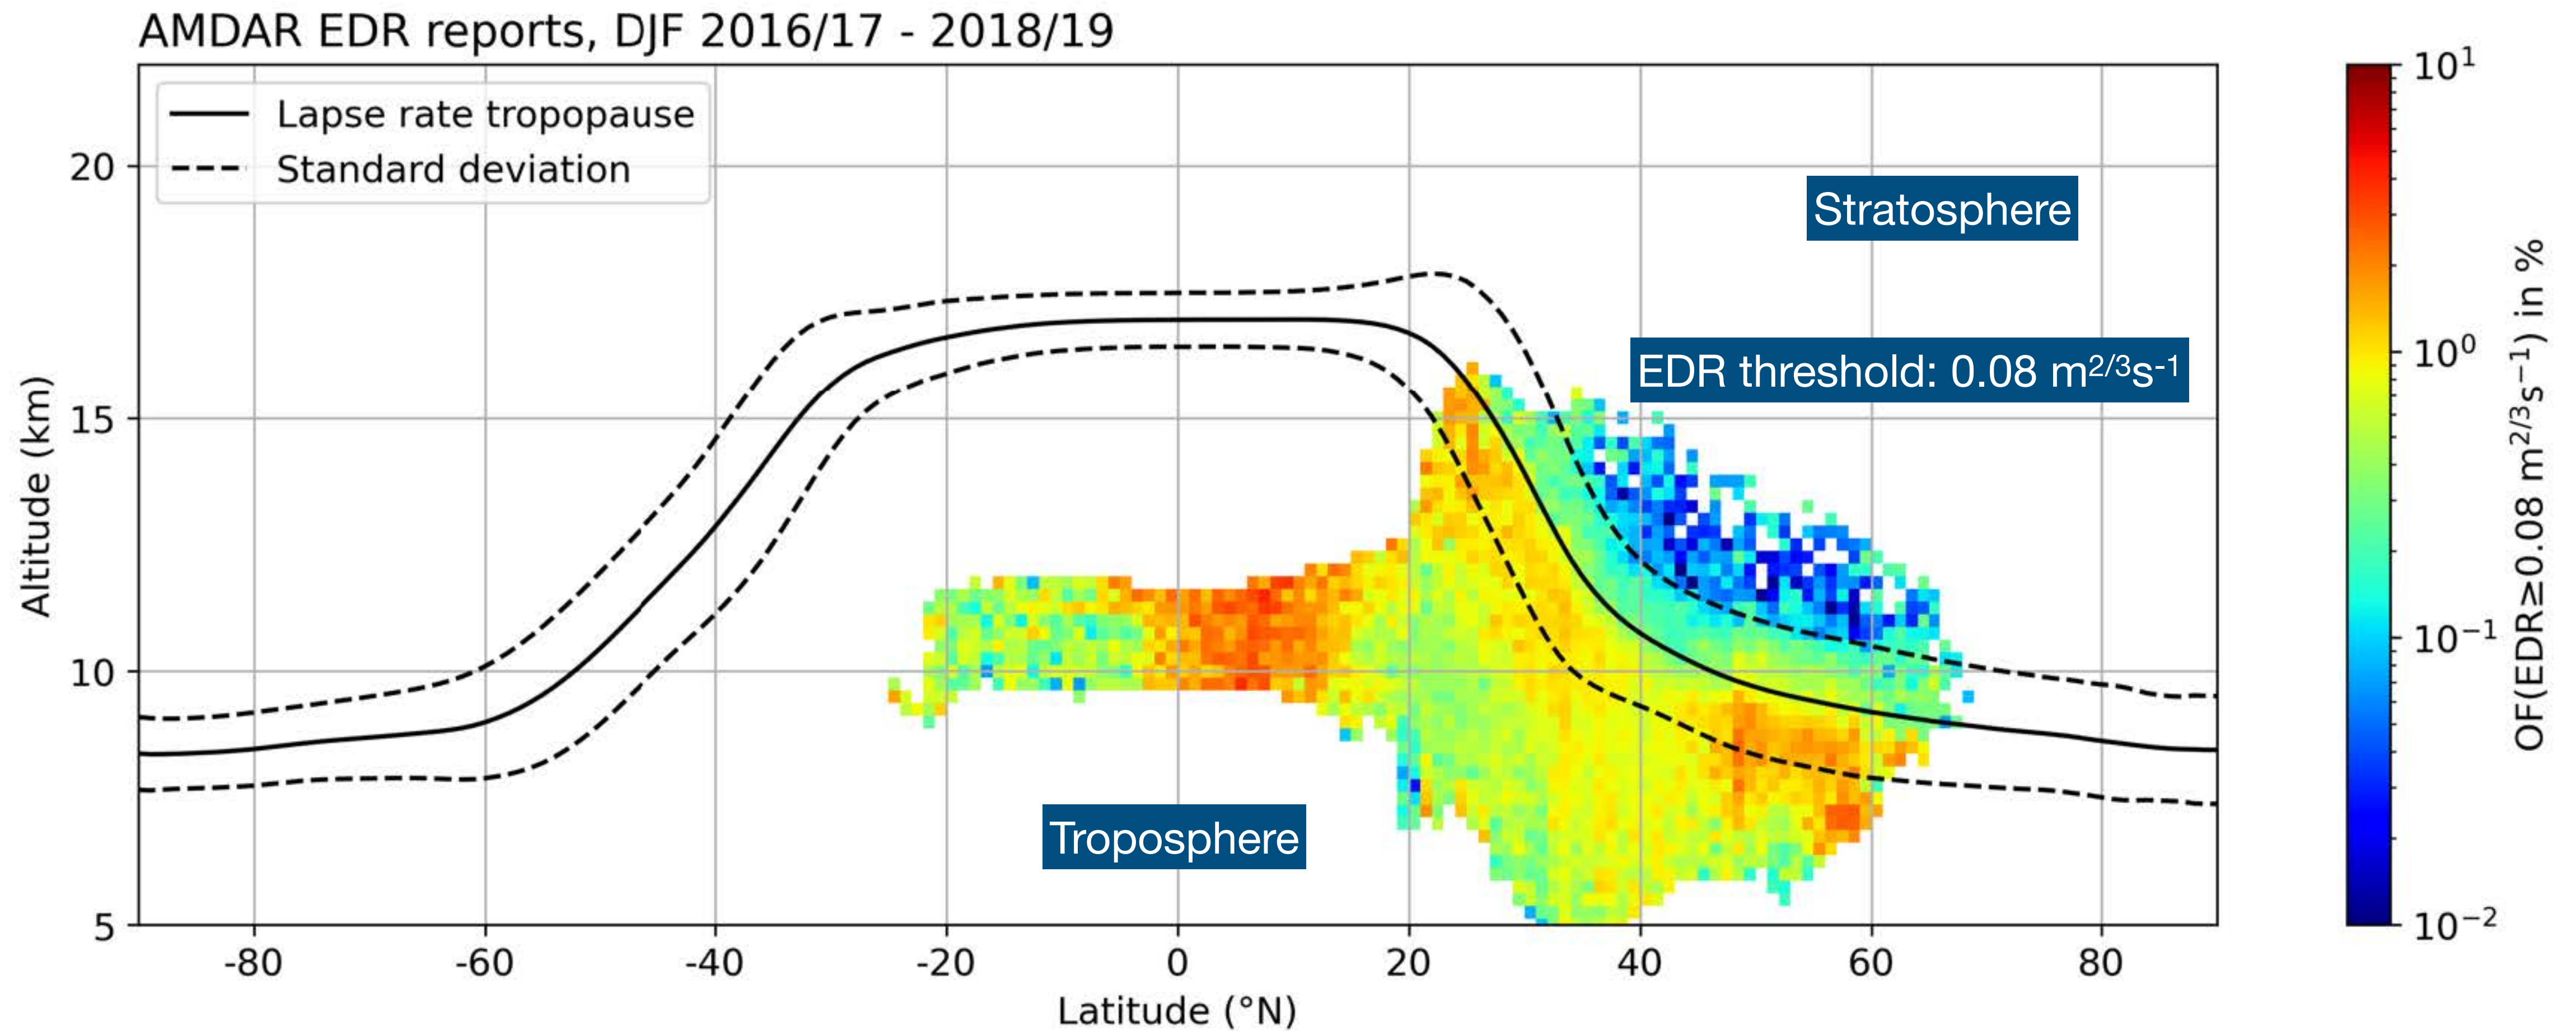

Motivation: Trace gas gradients

Motivation: Turbulent mixing

Motivation: Turbulent mixing

Motivation: Turbulent mixing

Data set

ERA5:

- Global, hourly
- Model level in vertical
- 0.25° horizontal

Turbulence diagnostics

Ground truth

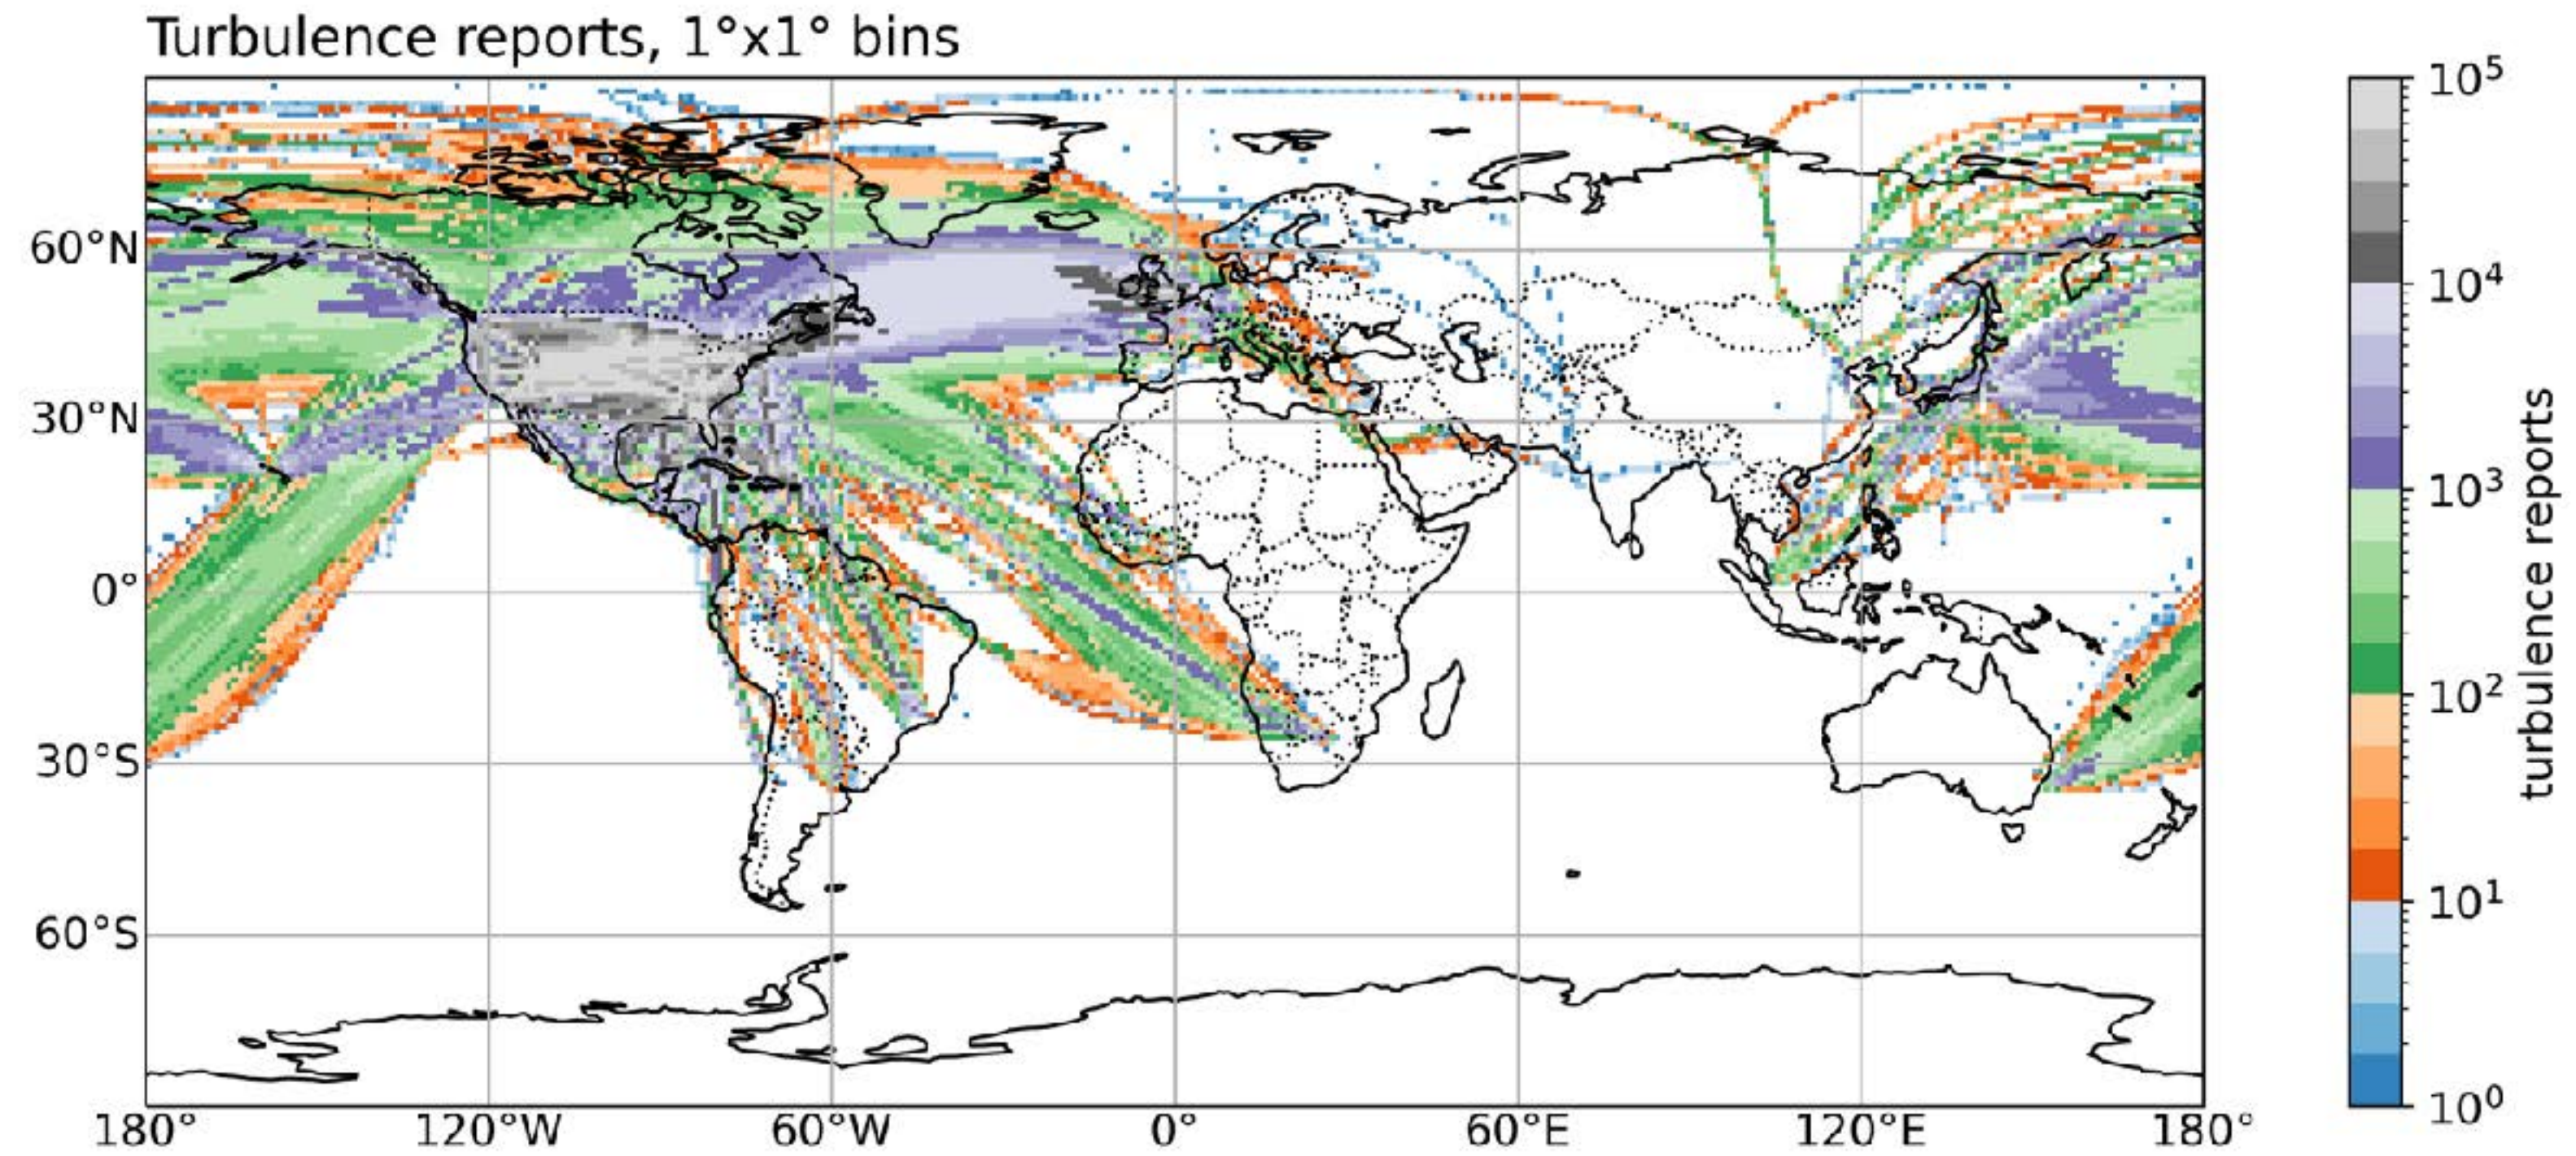

AMDAR

EDR reports:

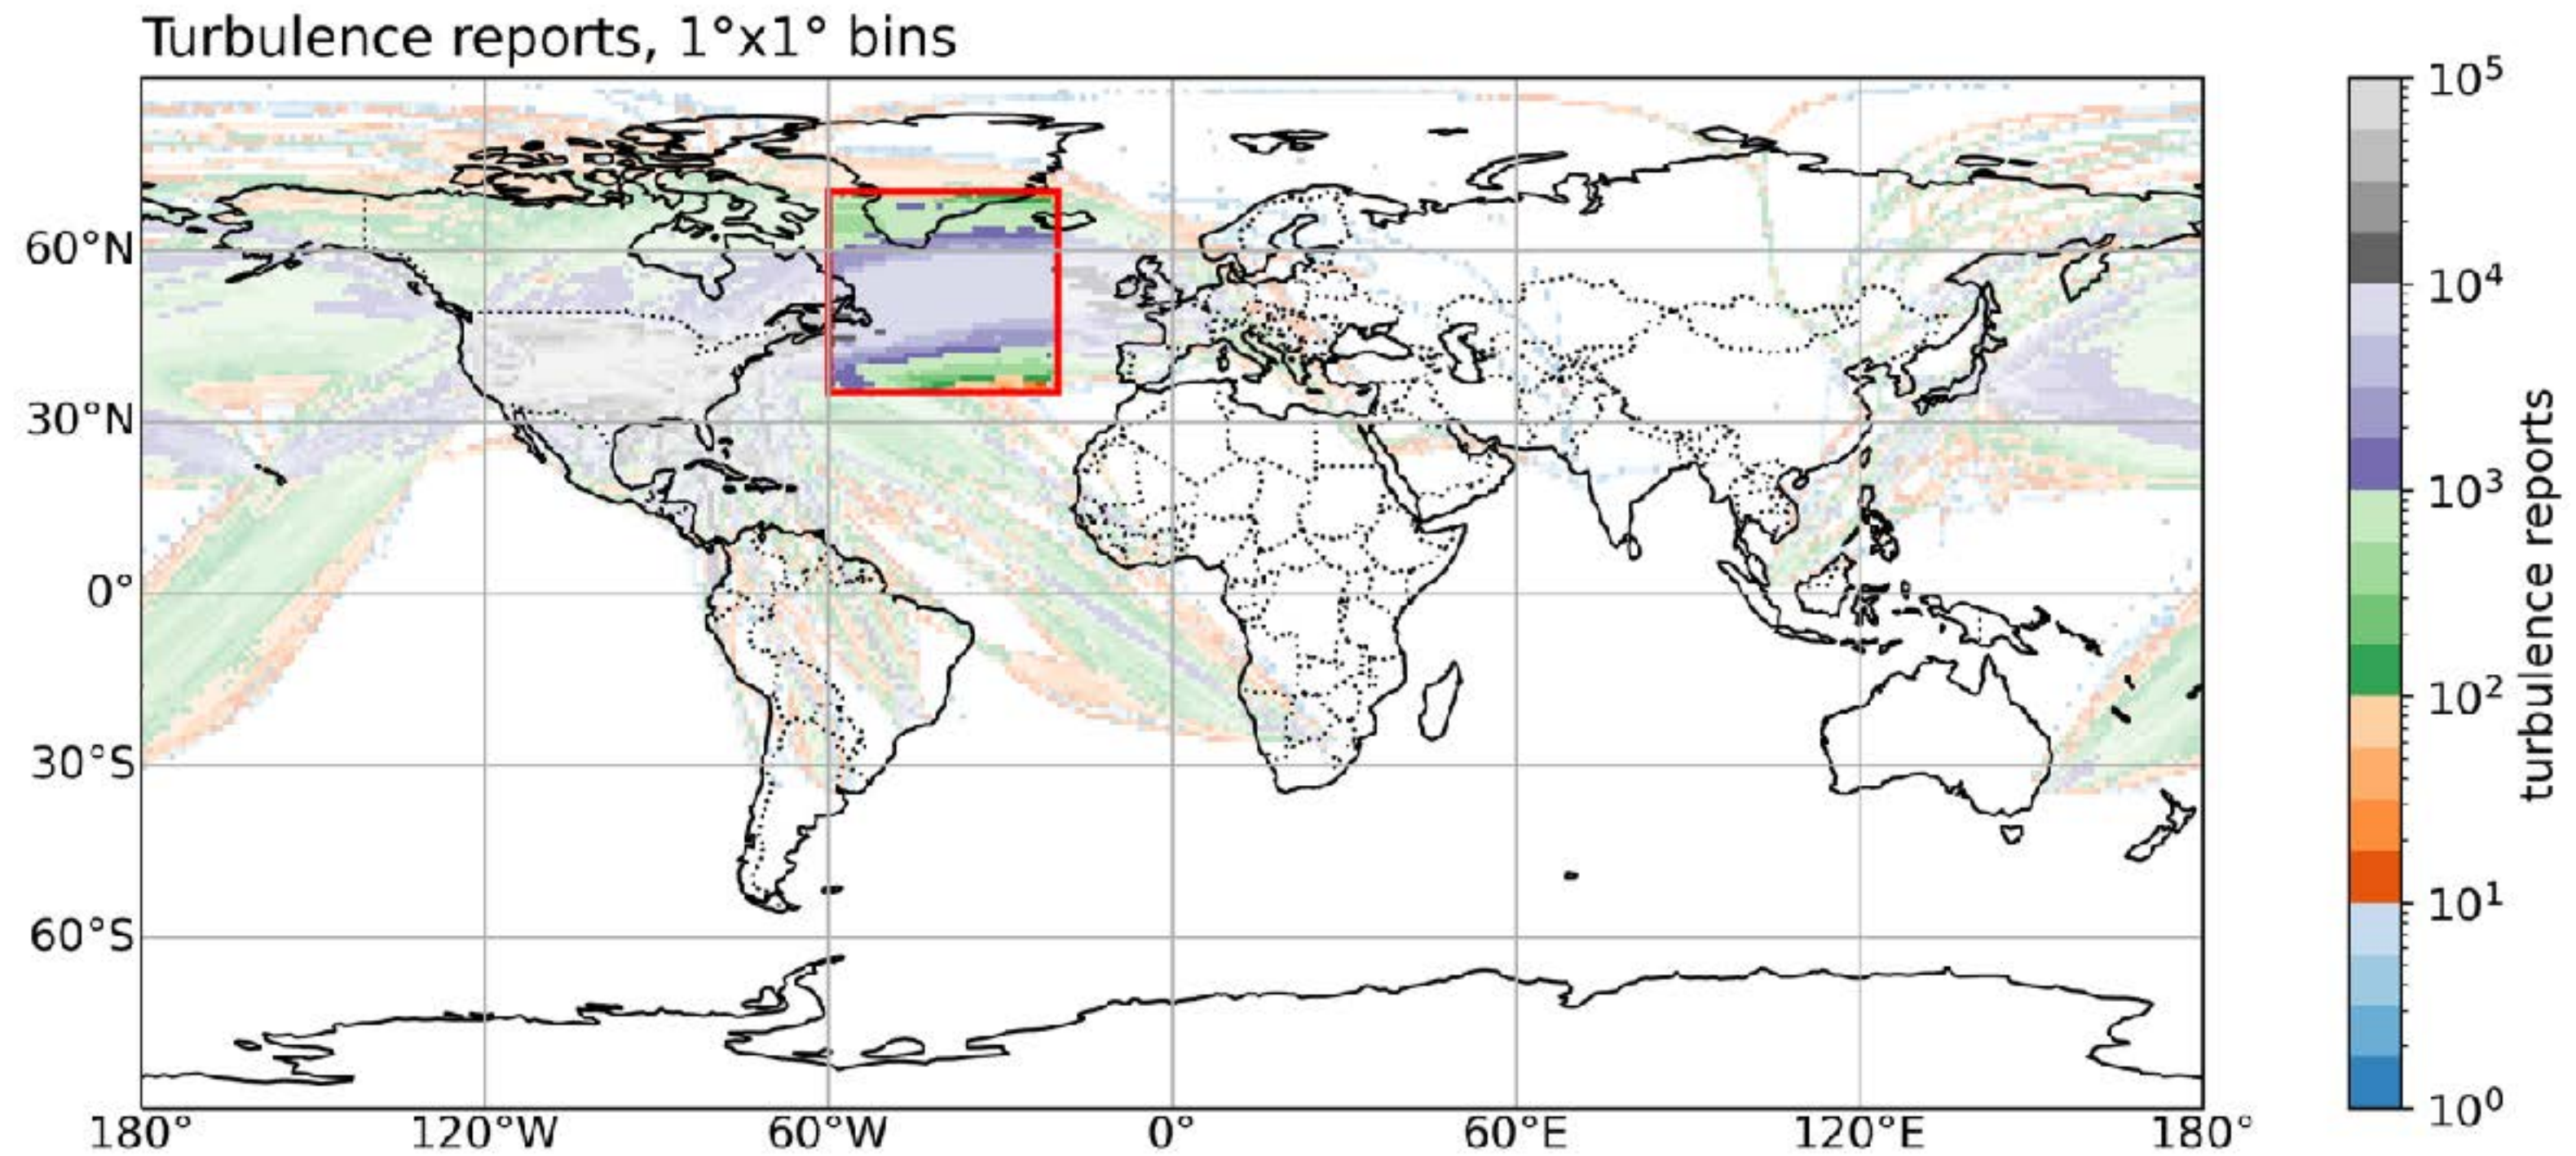

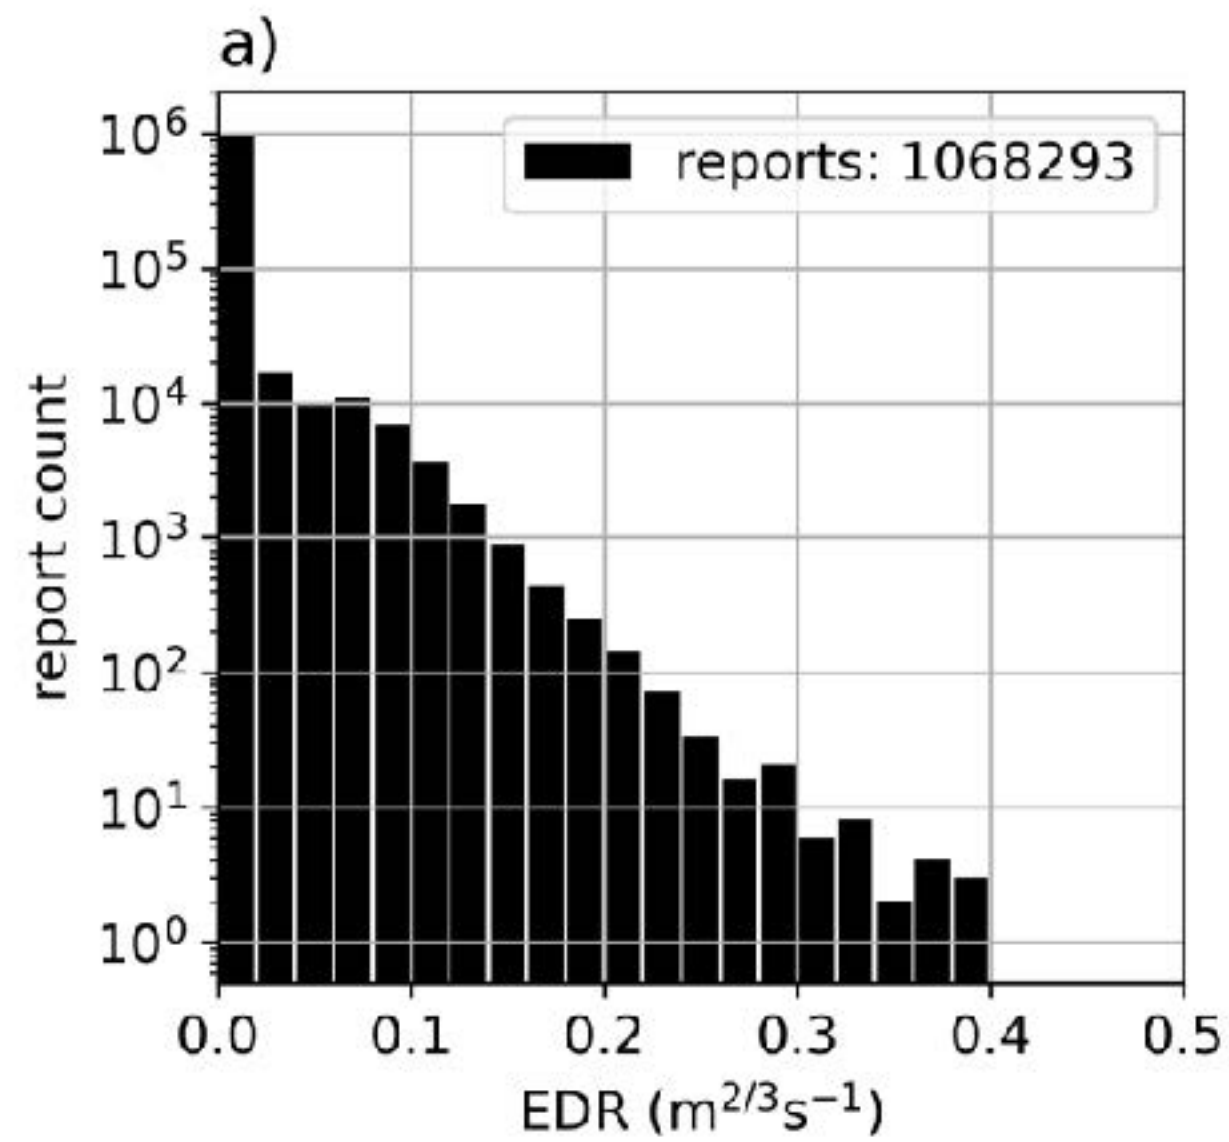

- 12.2016-12.2019
→ 63 million reports
- No JJA

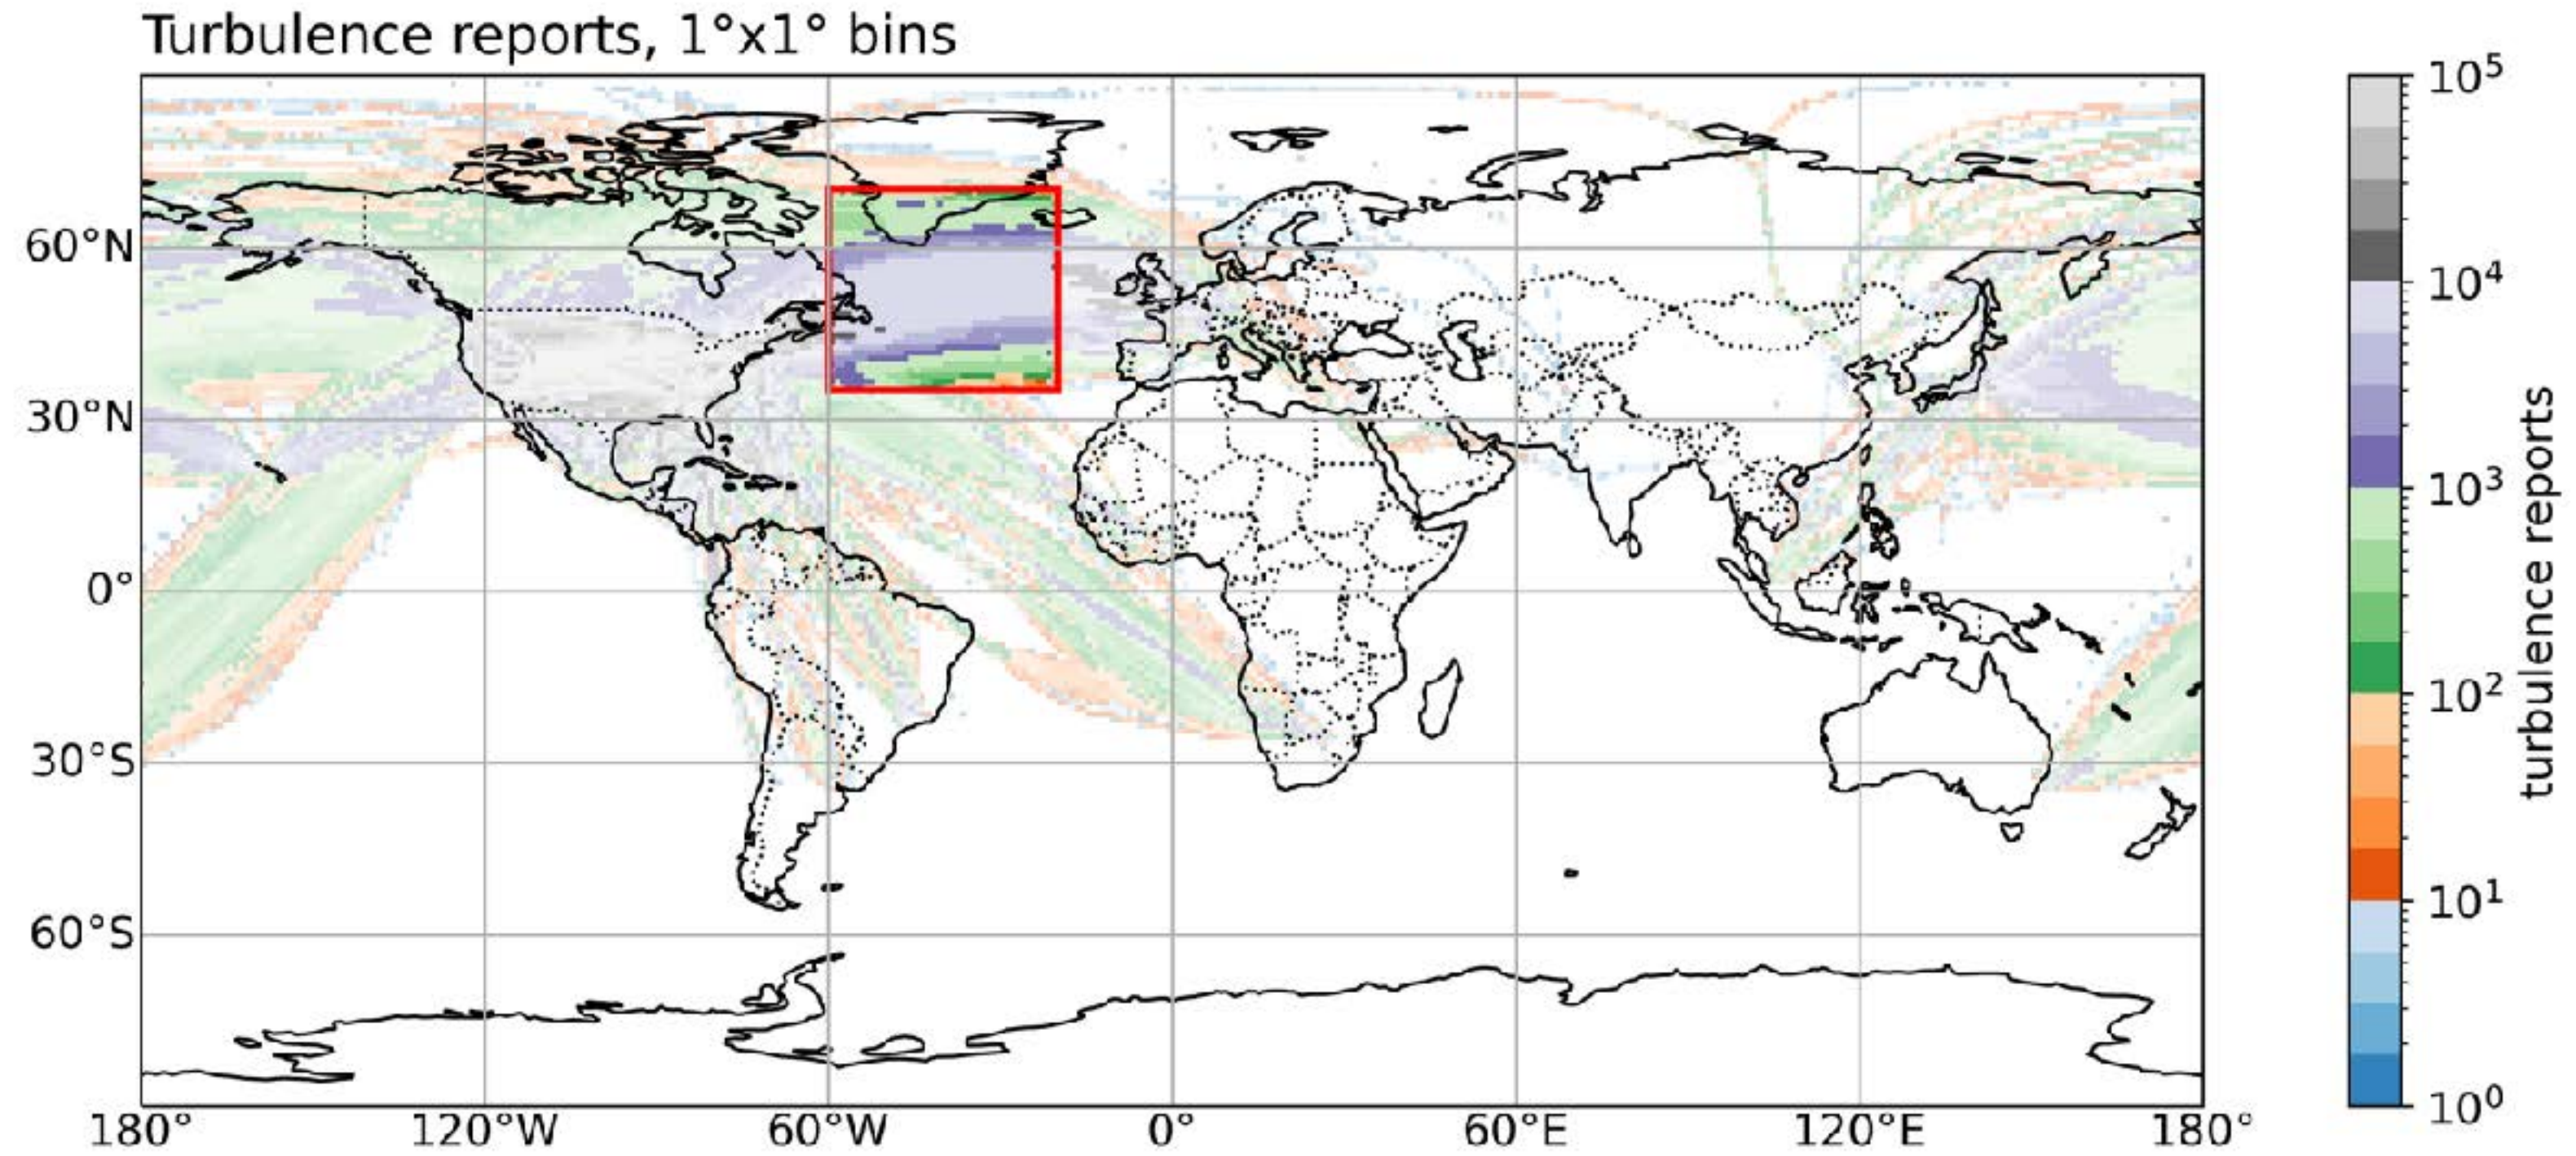

ERA5 diagnostics and ROC curves

Richardson number as benchmark diagnostic:
AUC as metric: 0.83

Random Forest Classifier

Random Forest Classifier

<https://doi.org/10.1029/2022GL100036>

Random Forest Classifier

Minimize loss:

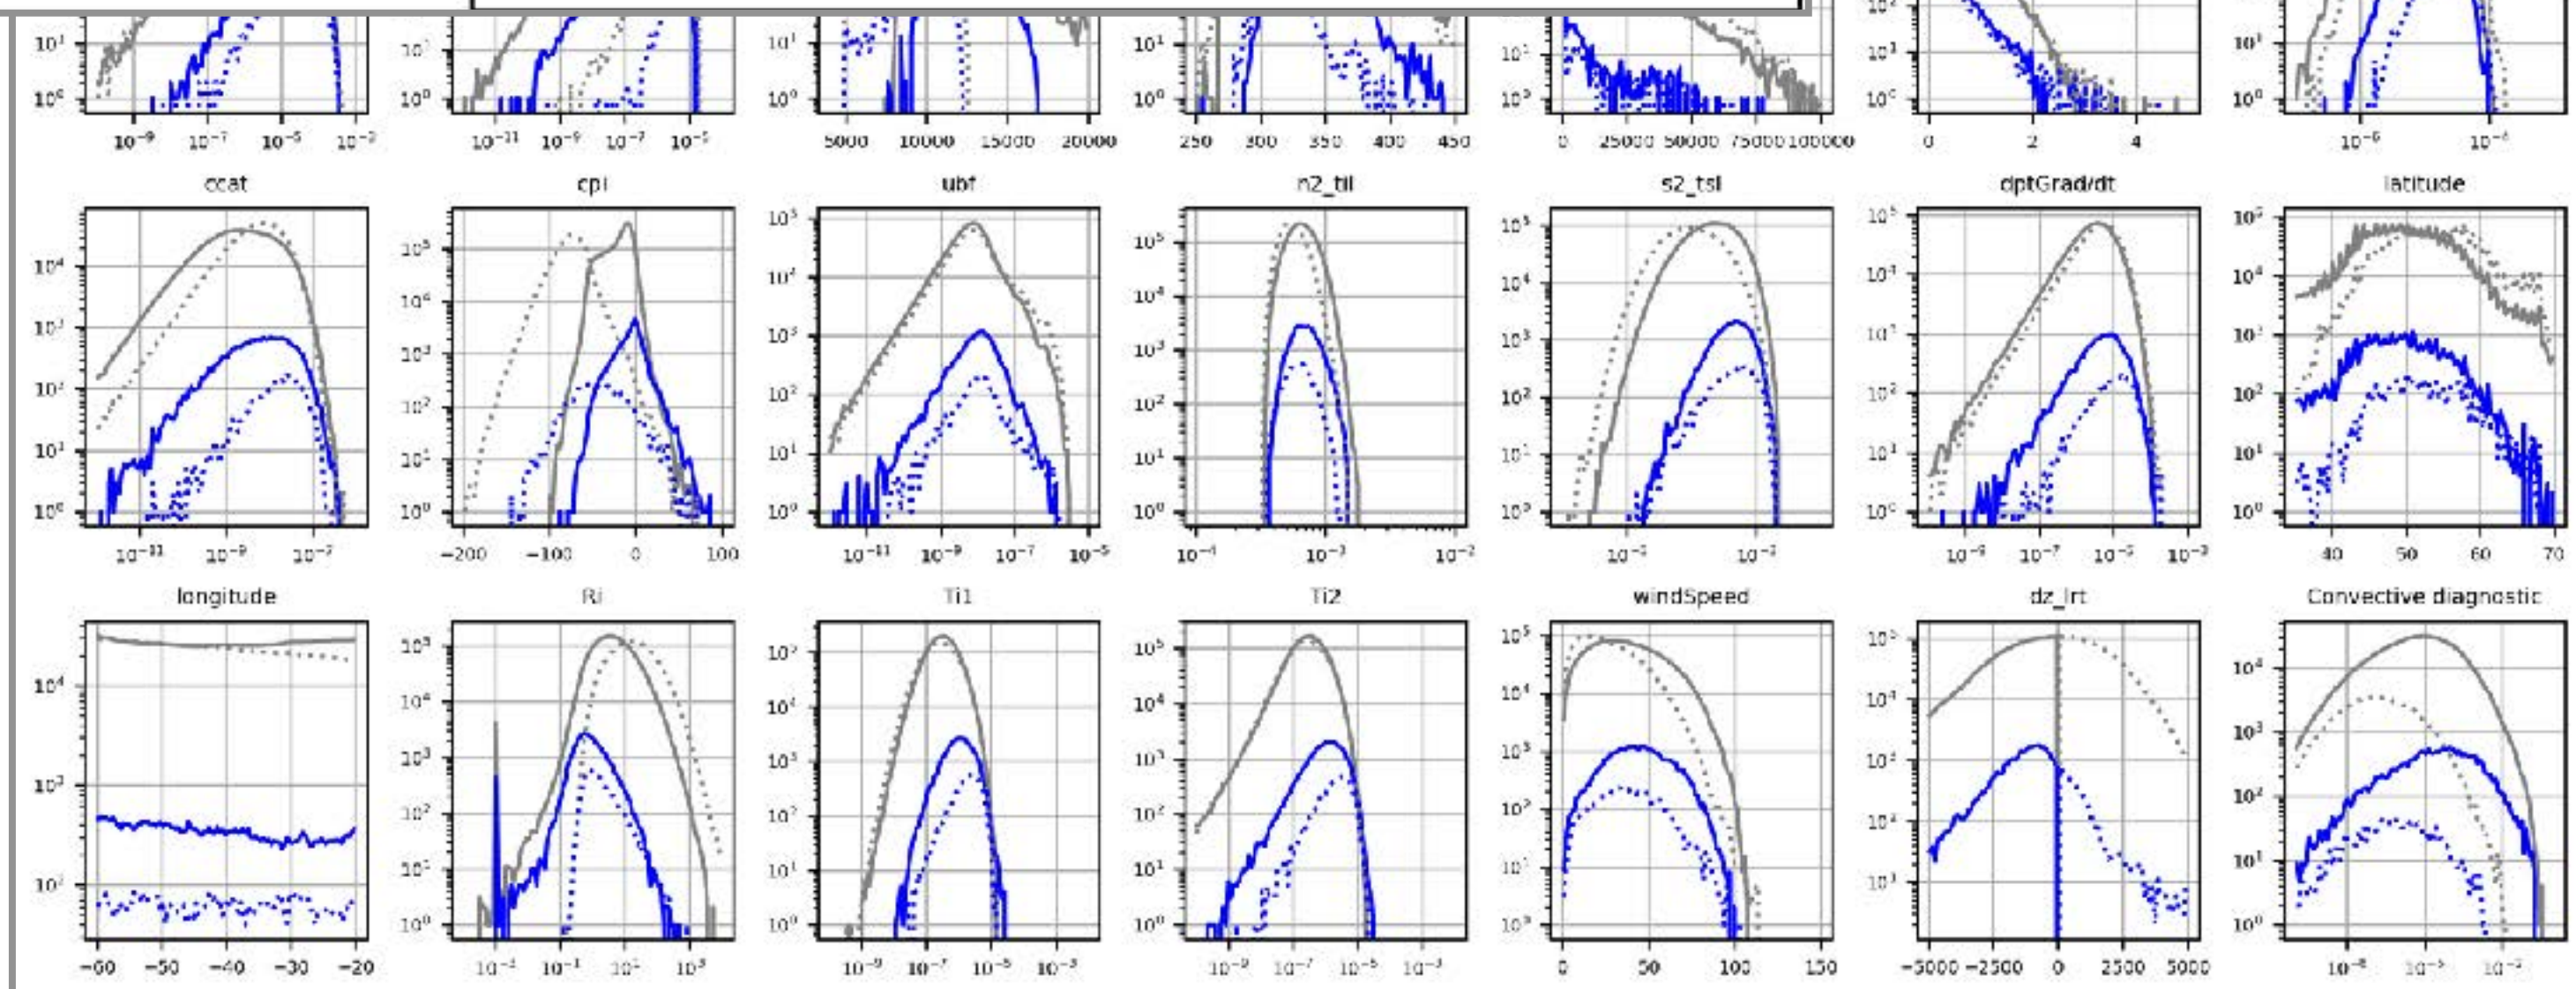

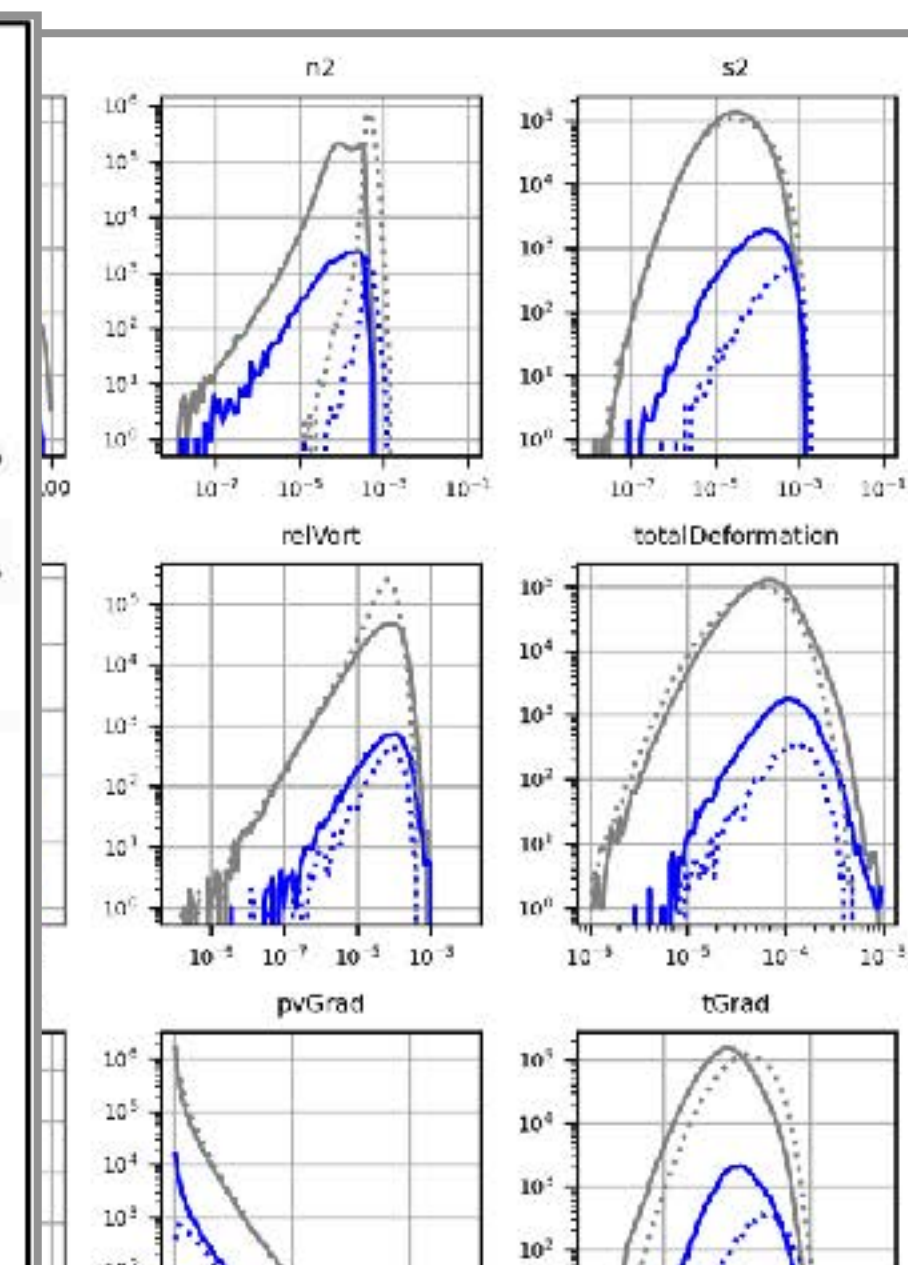

$$\Theta^* = \operatorname{argmin}_{\Theta} H(\Theta)$$

Define loss as weighted Gini impurity after split:

$$H(\Theta) = \sum_{b=1}^2 \frac{n^b}{n} G^b(\Theta)$$

Gini impurity:

$$G^b(\Theta) = \sum_k \frac{n_k^b}{n^b} \left(1 - \frac{n_k^b}{n^b}\right)$$

Random Forest Classifier

Minimize loss:

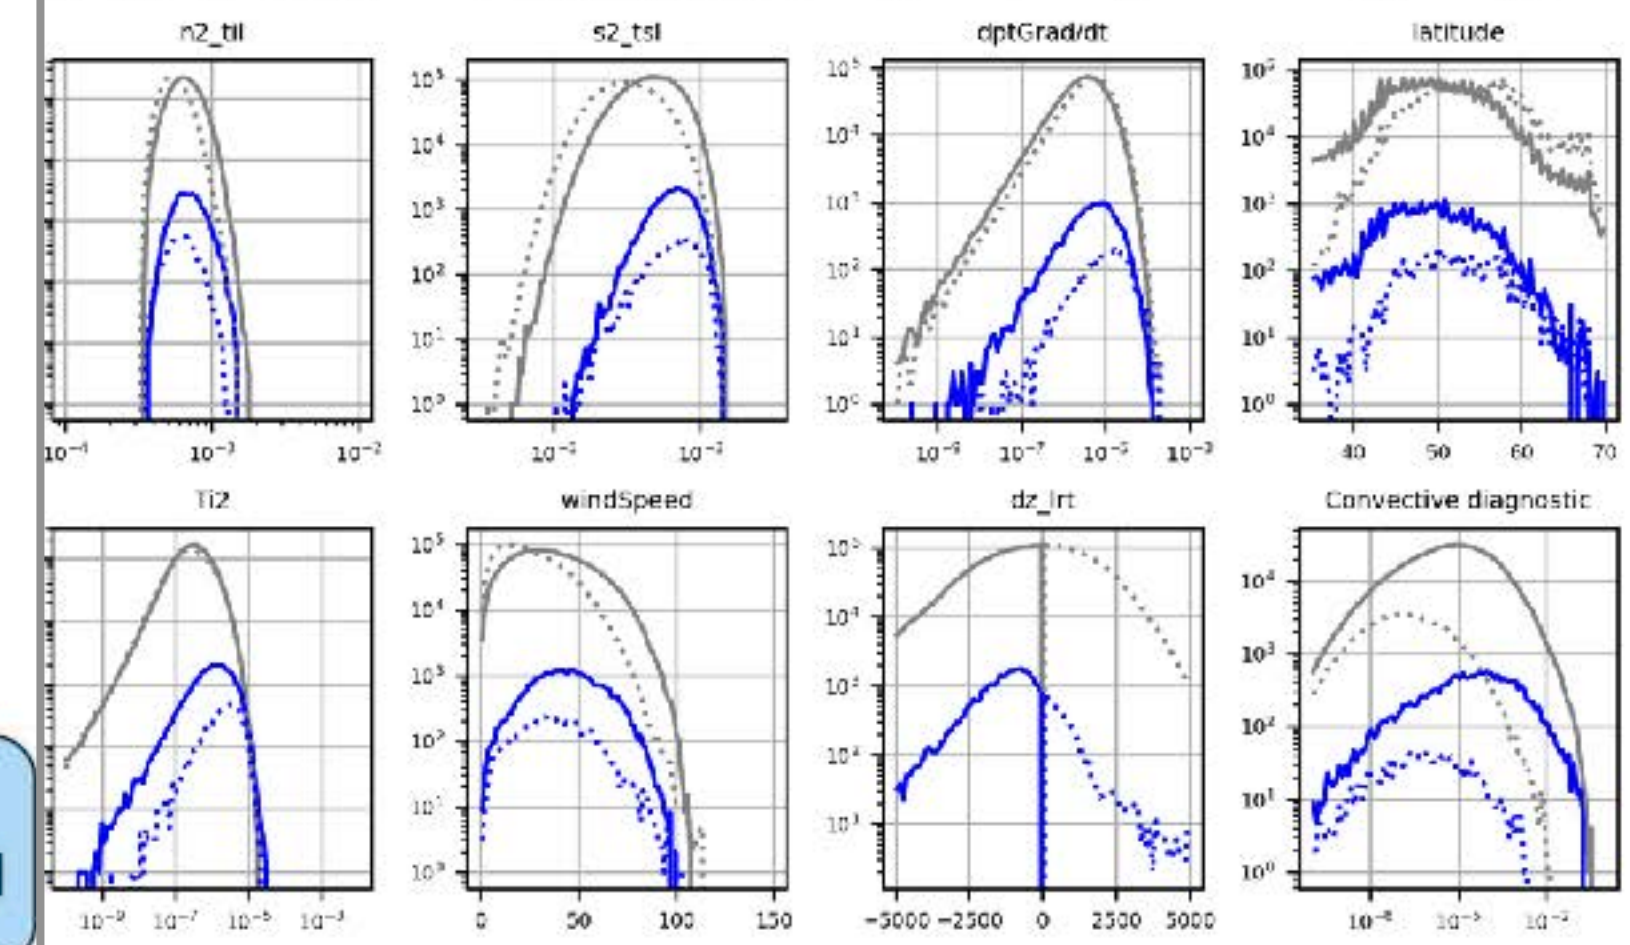

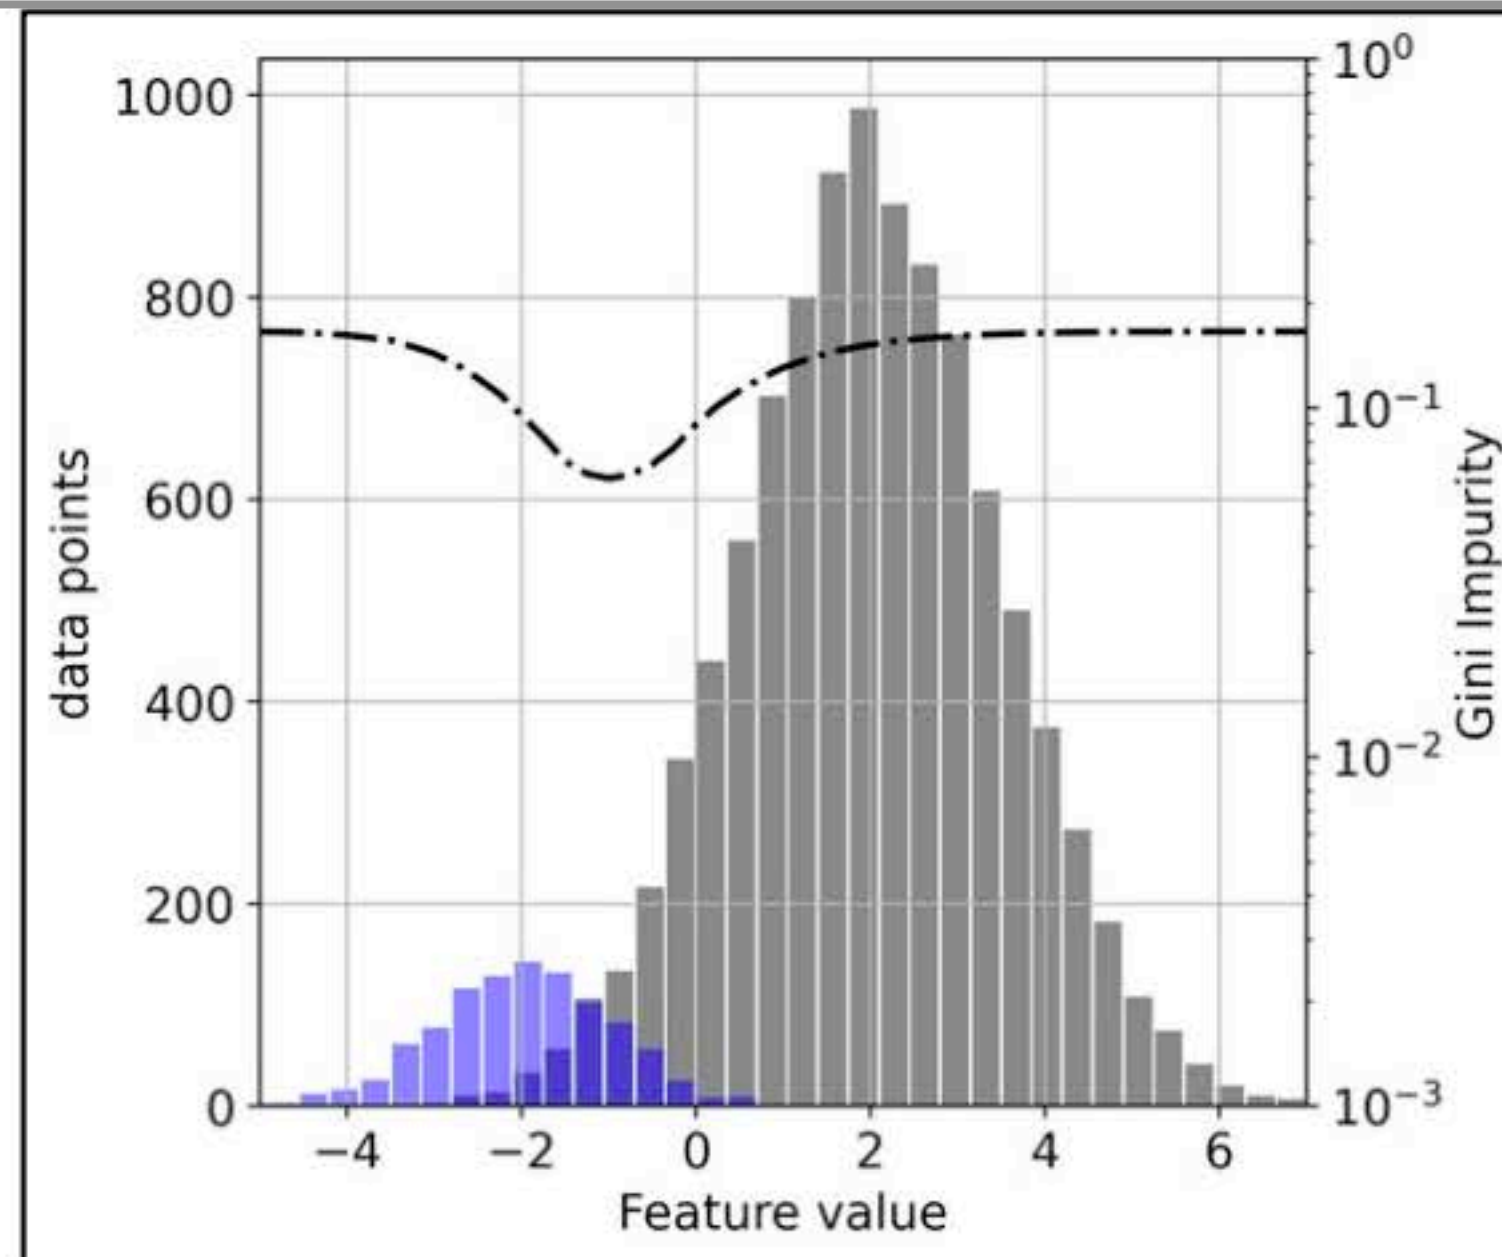

$$\Theta^* = \operatorname{argmin}_{\Theta} H(\Theta)$$

Define loss as weighted Gini impurity after split:

$$H(\Theta) = \sum_{b=1}^2 \frac{n^b}{n} G^b(\Theta)$$

Gini impurity:

$$G^b(\Theta) = \sum_k \frac{n_k^b}{n^b} \left(1 - \frac{n_k^b}{n^b}\right)$$

Ti1 (10^{-6} s^{-2}) ≤ 0.731
 gini = 0.5

Applicability

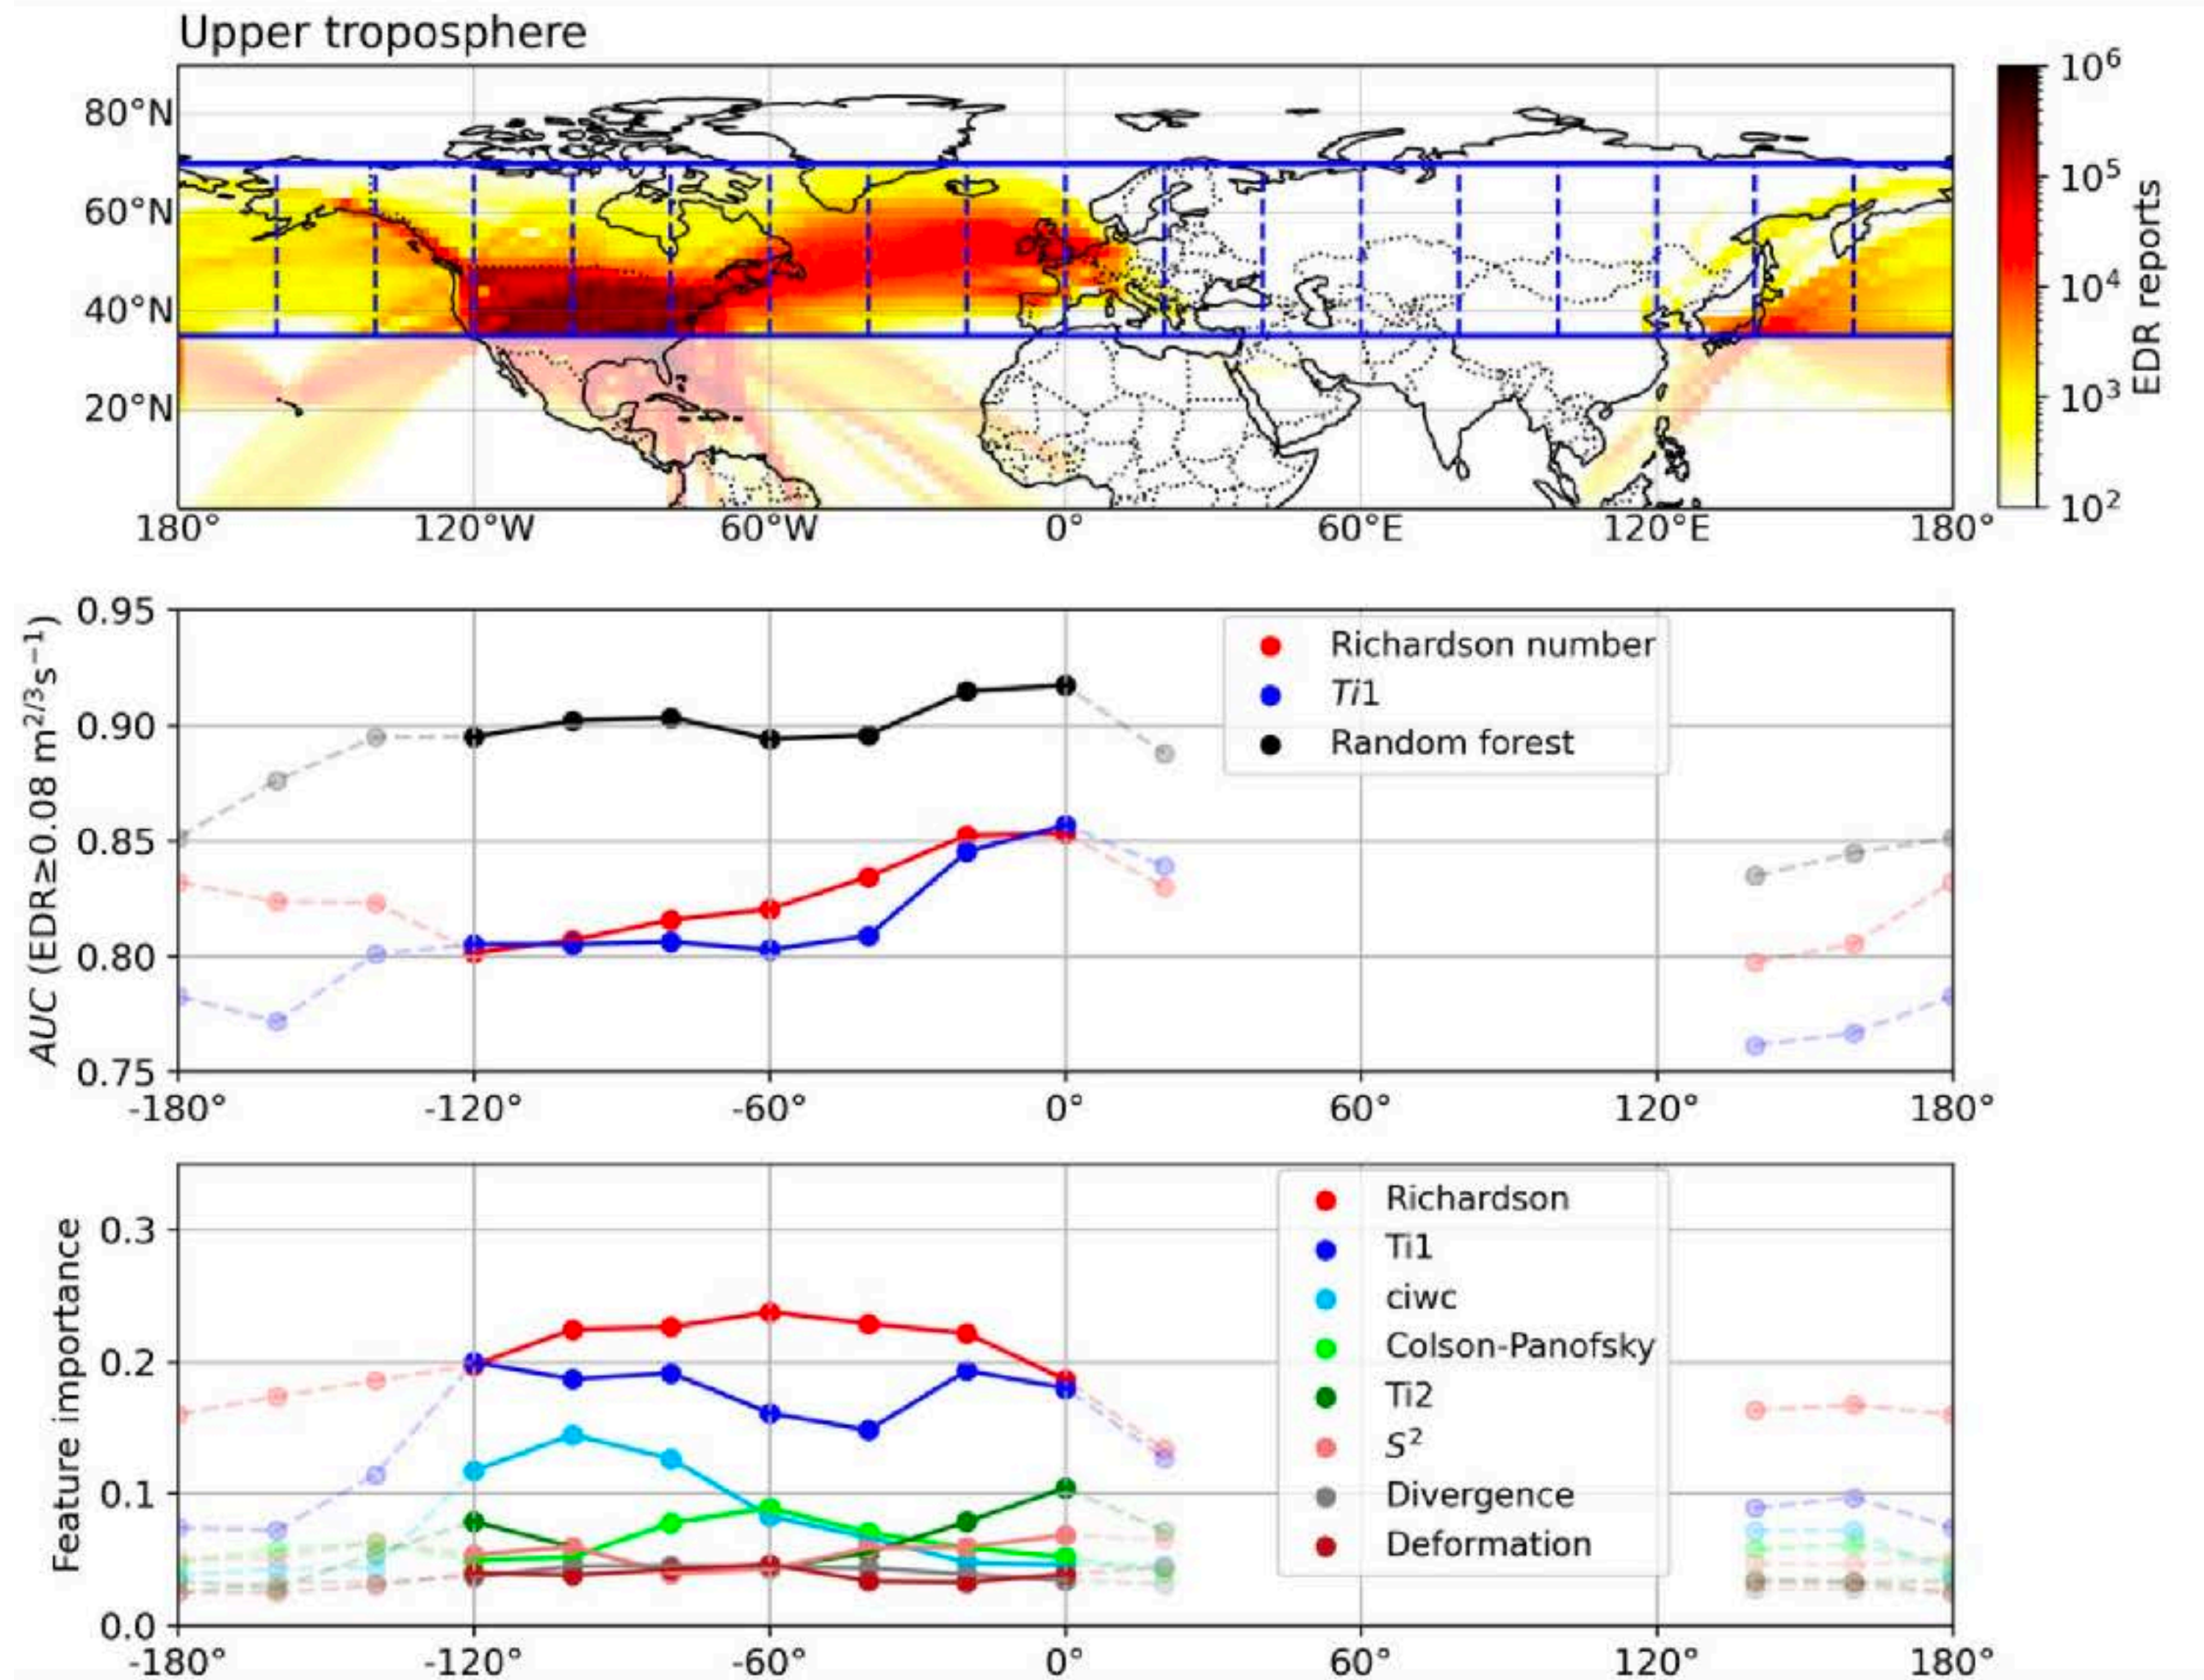

- **Probability of occurrence of turbulence in ERA5:**
 - Identify geographical hotspots
 - Hotspots in composites, relative to cyclone centre or jetstream
- Apply to IAGOS, analyze trace gas gradients relative to turbulence occurrence
- Compare with Thorpe analysis derived turbulence occurrence
- Turbulence forecast, for aviation or measurement campaigns
 - Comparison e.g. with GTG
- Analyze easiest to predict turbulence reports vs. hardest to predict
 - —> why do known diagnostics fail?
- Apply technique to any higher resolution NWP data (training + inference)

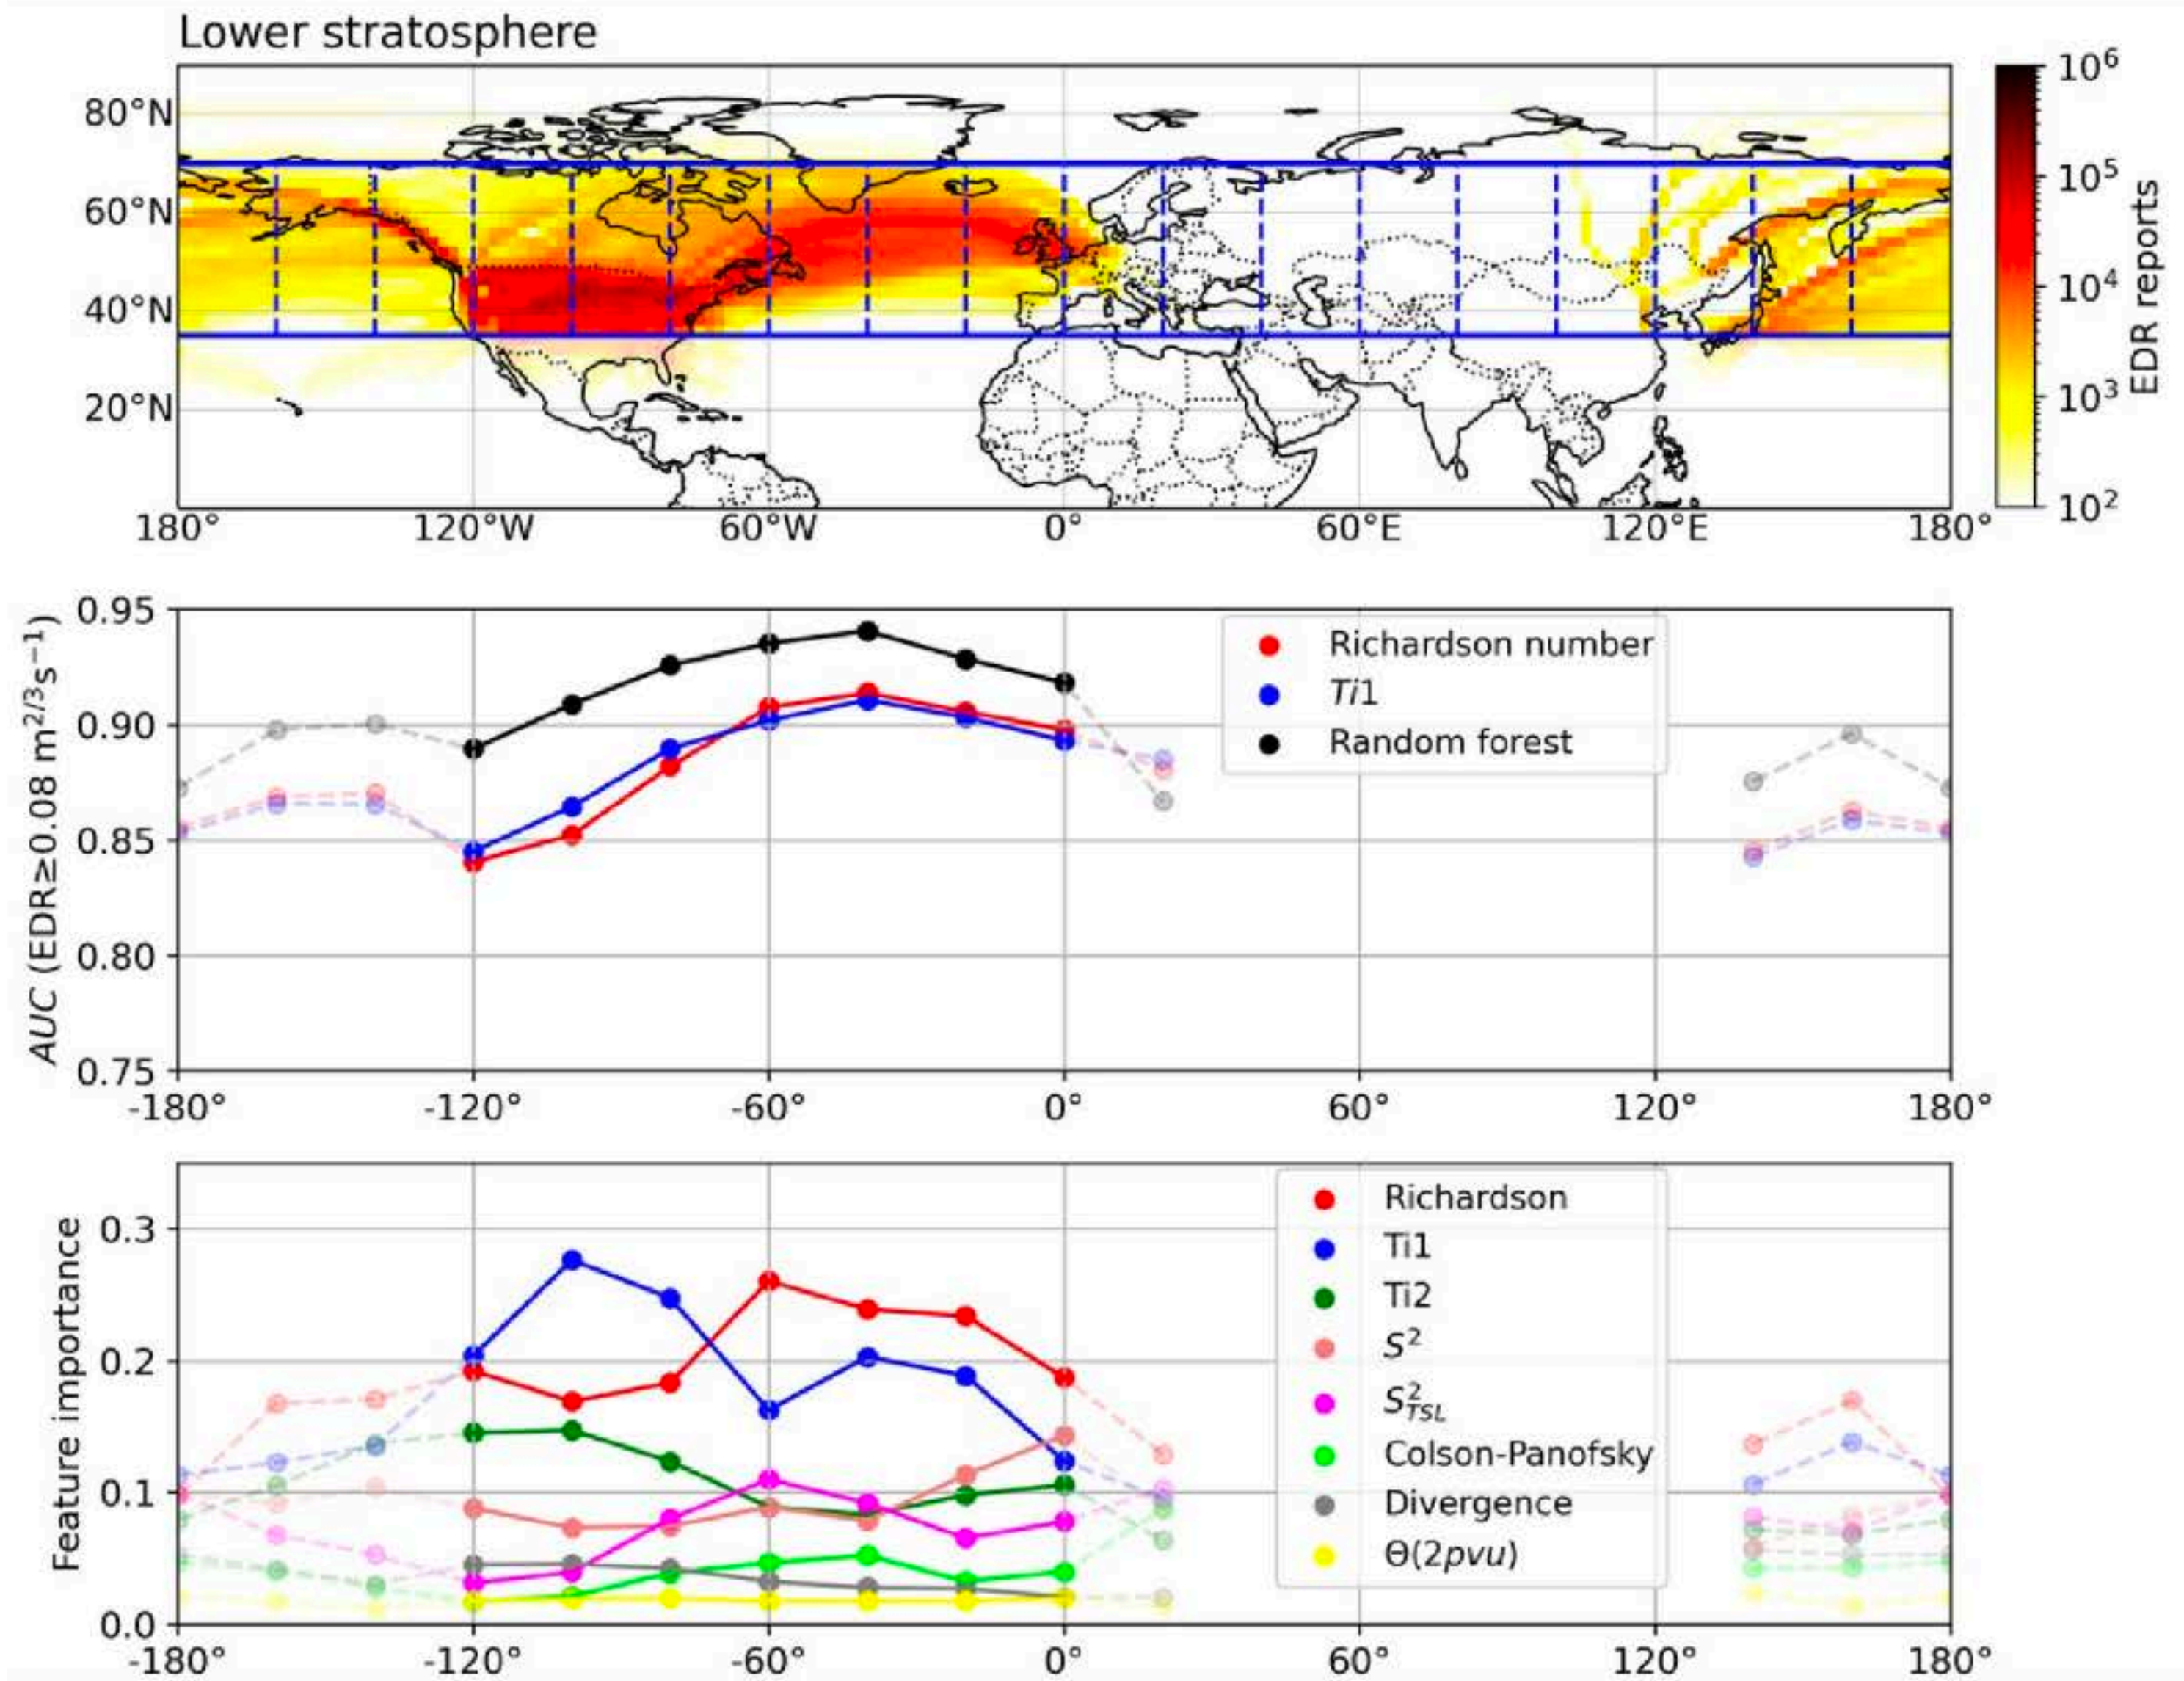

Thank you for your attention

- This study was made possible due to the data made available to the National Oceanic and Atmospheric Administration by the following commercial airlines: American, Delta, Federal Express, Northwest, United, and United Parcel Service.
- The ECMWF provided the ERA5 data which has been retrieved from the MARS system.
- In-service aircraft for a global observing system (IAGOS) data were created with support from the European Commission, national agencies in Germany (BMBF), France (MESR), and the UK (NERC), and the IAGOS member institutions (<http://www.iagos.org/partners>). The participating airlines (Lufthansa, Air France, Austrian, China Airlines, Iberia, Cathay Pacific, Air Namibia, Sabena) supported IAGOS by carrying the measurement equipment free of charge since 1994.
