Climate Prediction Applications Science Workshop.

March 02-04, 2010

San Diego, CA

Overview

- CIMIS
 - Introduction and history.
 - Stations and data.
 - Users and uses.
 - Data gaps.
 - Spatial CIMIS (CIMIS-GOES)
 - The CIMIS-GOES project.
 - Data collection and calculations.
 - Model refinements and future plans.
 - Demonstration.
-

What is CIMIS?

- A network of over 130 fully automated weather stations that collect weather data throughout California and provide estimates of reference evapotranspiration (ET_o) to the users.
-

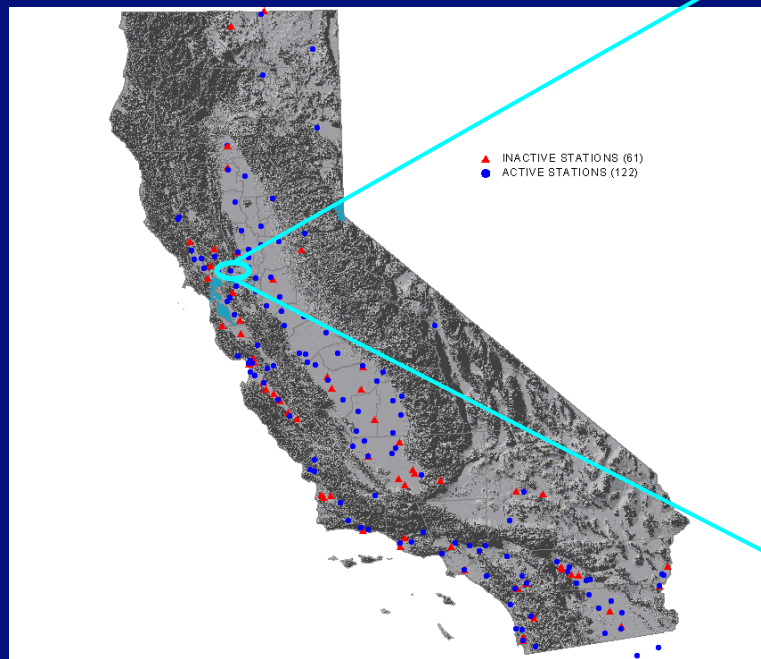

What is ETo?

- ETo is evaporation plus transpiration from well-watered grass surfaces over which the stations stand.
 - Crop coefficients (K_c) are used to convert ETo into actual ET for a specific crop (ET_c).
 - CIMIS uses the Modified Penman and the Penman-Monteith equations to calculate ETo.
-

CIMIS station locations.

- Spatial data gaps exists.

Brief History.

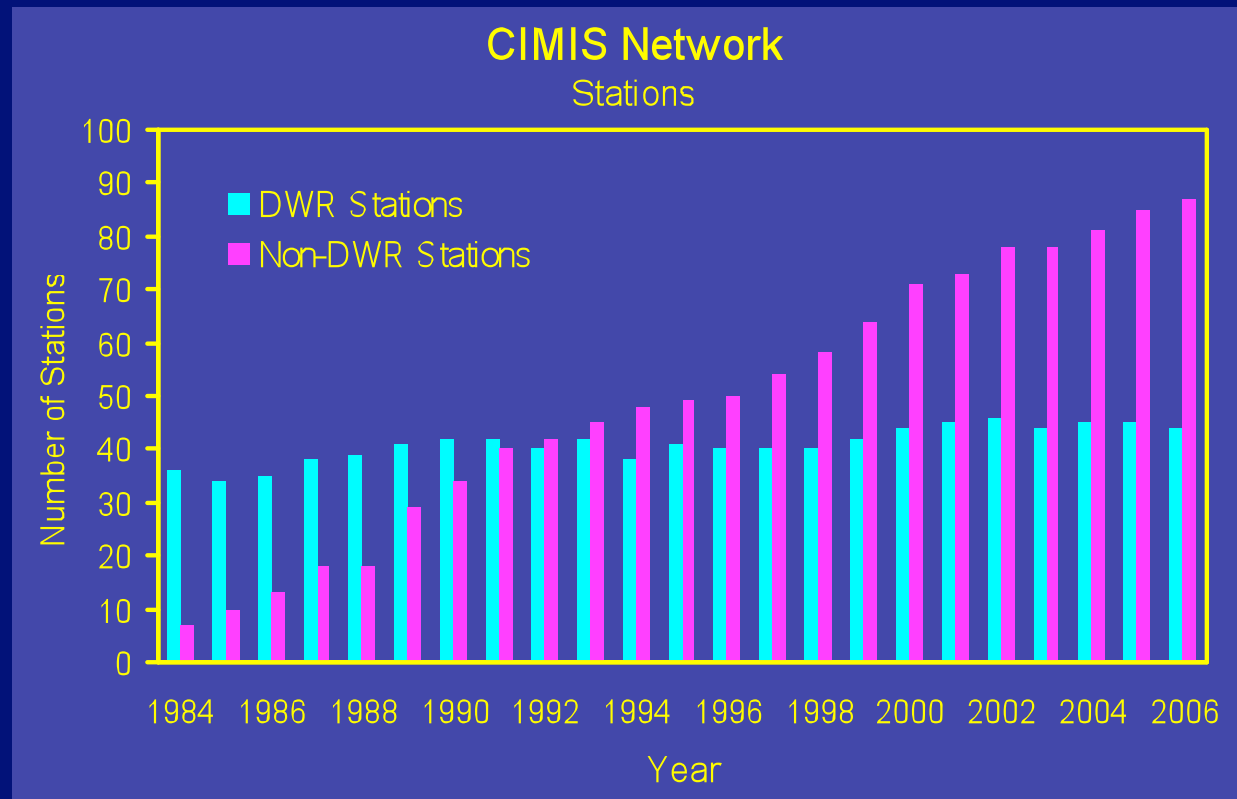

- 1982 - CIMIS was developed by DWR and the University of California Davis.
 - 1985 - DWR assumed control of all the management and operations of the CIMIS program.
 - 2002 – data access changed to web only with FTP site for automated downloads.
 - 2009/2010 – significant CIMIS upgrade.
-

Ownership.

- ❑ Some CIMIS stations are owned by DWR.
 - ❑ Others are owned by cooperators, such as:
 - Local water agencies.
 - Universities.
 - Cities.
 - U.S. Department of Agriculture (USDA).
 - U.S. Bureau of Reclamation (USBR).
 - Conservation Districts (CD)..
 - Private industries.
-

Ownership (cont.)

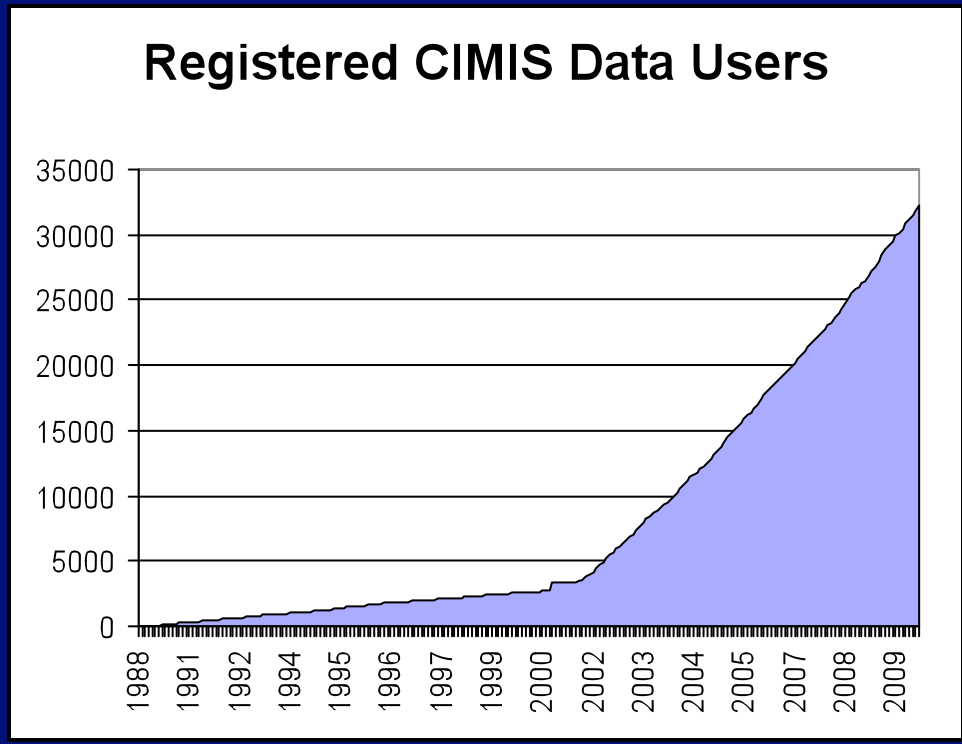

Who uses CIMIS data?

- Growers.
 - Consultants.
 - Water agencies.
 - Public agencies.
 - Home owners.
 - Researchers.
 - Firefighters.
 - Investigators
-

Registered Primary Users

For what purposes?

- Irrigation scheduling.
 - Pest management.
 - Air quality monitoring.
 - Firefighting.
 - Modeling.
 - Energy generation.
 - Engineering designs.
 - Weather forecasting.
 - Research.
-

How does CIMIS work?

- ❑ Dataloggers poll the sensors every minute.
 - ❑ Solar radiation (R_s), air temperature (T_a), wind speed (U_2), and Relative Humidity (RH) are measured.
 - ❑ Sixty minute-by-minute readings are averaged/totalled to produce hourly data.
 - ❑ Daily maximum, minimum, average, and total values are calculated by the end of each day.
-

How does ... (cont.)

- ❑ The CIMIS computer calls all stations every six hours and retrieves data.
 - ❑ Reference evapotranspiration (ET_o) is calculated.
 - ❑ Data goes through quality control (QC) procedures.
 - ❑ Measured and calculated parameters are stored in the CIMIS database.
-

Spatial CIMIS/CIMIS-GOES

- Is a project that CIMIS initiated with UC Davis to explore the potential for using remotely sensed data for the estimation of ETo (to mitigate the spatial data gap).
 - The Geostationary Operational Environmental Satellites (GOES) were selected, hence CIMIS GOES.
 - Provides spatially distributed daily ETo values at 2-km resolution.
-

ET_o estimation.

- The ASCE version of the PM equation is used:

$$ET_o = \frac{0.408\Delta(Rn - G) + \gamma \frac{900}{T + 273} u_2 (es - ea)}{\Delta + \gamma(1 + 0.34u_2)}$$

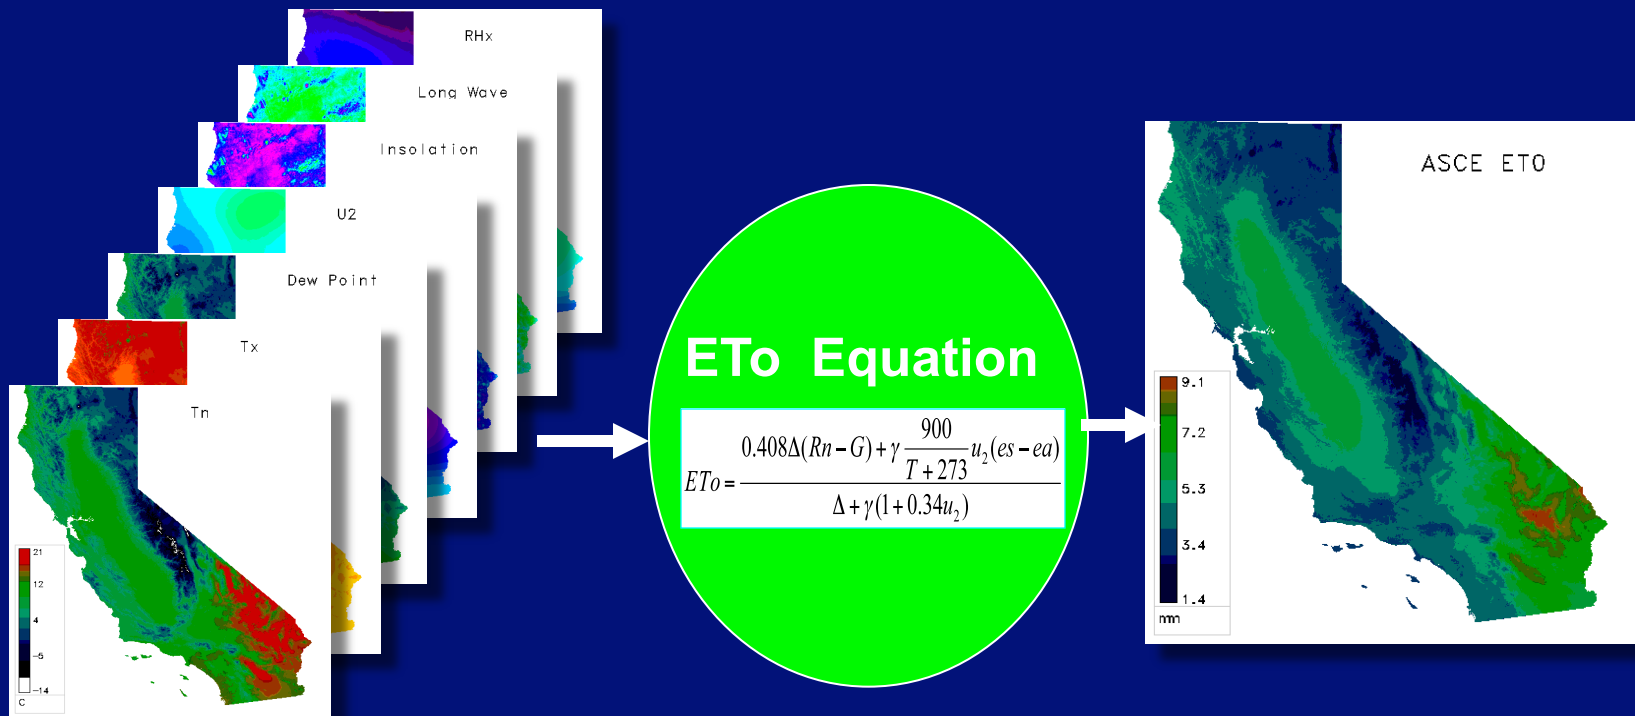

- Net radiation (R_n) is calculated from net shortwave (R_{ns}) and net longwave (R_{nl}) radiations.
 - R_{ns} is calculated from solar radiation (R_s), which is in turn derived from the GOES.
-

ETo Estimation (cont.)

- Rnl is calculated from air temperature, vapor pressure, and solar radiations (actual and clear sky).
 - Air temperature, relative humidity, and wind speed are interpolated from CIMIS stations
 - There is a plan to use the WRF model to derive some of these parameters and to forecast ETo.
-

ETo Estimation (cont.)

Solar Radiation.

- Heliosat II model is used to estimate solar radiation.
 - Cloud brightness (n) is estimated from GOES visible images.
 - Clear sky factor (K) is calculated as a function of cloud brightness, $K = f(n)$.
 - R_s is then calculated from K and clear sky solar radiation (R_{so}).
 - $R_s = K * R_{so}$
-

Solar Radiation (cont.)

- Using 3 years worth of data for comparison, the GOES Rs was higher by about 2% with an R^2 of 0.99.

Solar Radiation (cont.)

$$R_{sg} = 0.89R_{sc} + 31.9$$

$$r^2 = 0.94$$

Ta, RH, and U2.

- Two interpolation methods were used; DayMet and Spline.
 - DayMet - generates daily surfaces of temperature, humidity, precipitation, and radiation over large regions of complex terrain using truncated Gaussian weighting filter.
 - Spline – fits a surface through or near known points using a function with continuous derivatives
-

Model Refinements.

- ❑ Snow versus cloud.
 - ❑ Surface reflectance (albedo) values.
 - ❑ Turbidity.
 - ❑ Interpolation versus model.
-

Future Plans.

- ETo forecast.
- Land use and crop-coefficient (K_c) maps.
- Interactive data delivery with improved features.

Spatial CIMIS.

The screenshot shows the Spatial CIMIS website interface. At the top, there is a header with the California state logo and the text "CALIFORNIA THE GOLDEN STATE". To the right of the header are links for "CALIFORNIA HOMEPAGE" and "GOVERNOR'S HOMEPAGE". Below the header is a large banner with the "CIMIS" logo and the text "CALIFORNIA IRRIGATION MANAGEMENT INFORMATION SYSTEM DEPARTMENT OF WATER RESOURCES OFFICE OF WATER USE EFFICIENCY". A navigation bar below the banner contains buttons for "WELCOME", "INFO CENTER", "CIMIS DATA", "RESOURCE CENTER", "My CIMIS", and "SPATIAL CIMIS". The main content area is divided into a left sidebar and a main content pane. The sidebar has sections for "General", "View Maps", and "Generate Report". The main content pane displays the "Spatial CIMIS" title and a description of the system's capabilities. A small image of a satellite in orbit is shown on the right side of the main content area.

Spatial CIMIS

The **Spatial CIMIS** page provides the ability to view daily reference evapotranspiration (ETo), daily solar radiation (Rs), station location, and long-term average ETo zones maps and to generate daily ETo and Rs data at 2 km spatial resolution for the State of California.

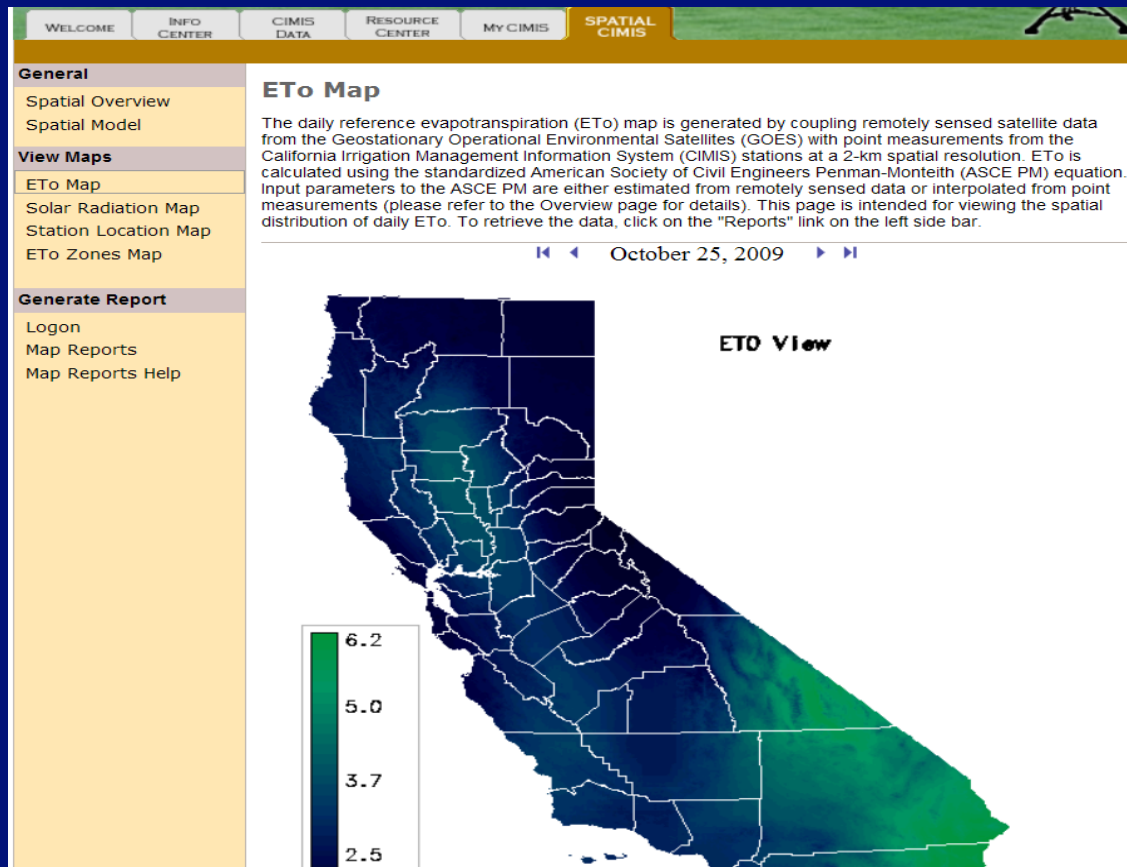

General

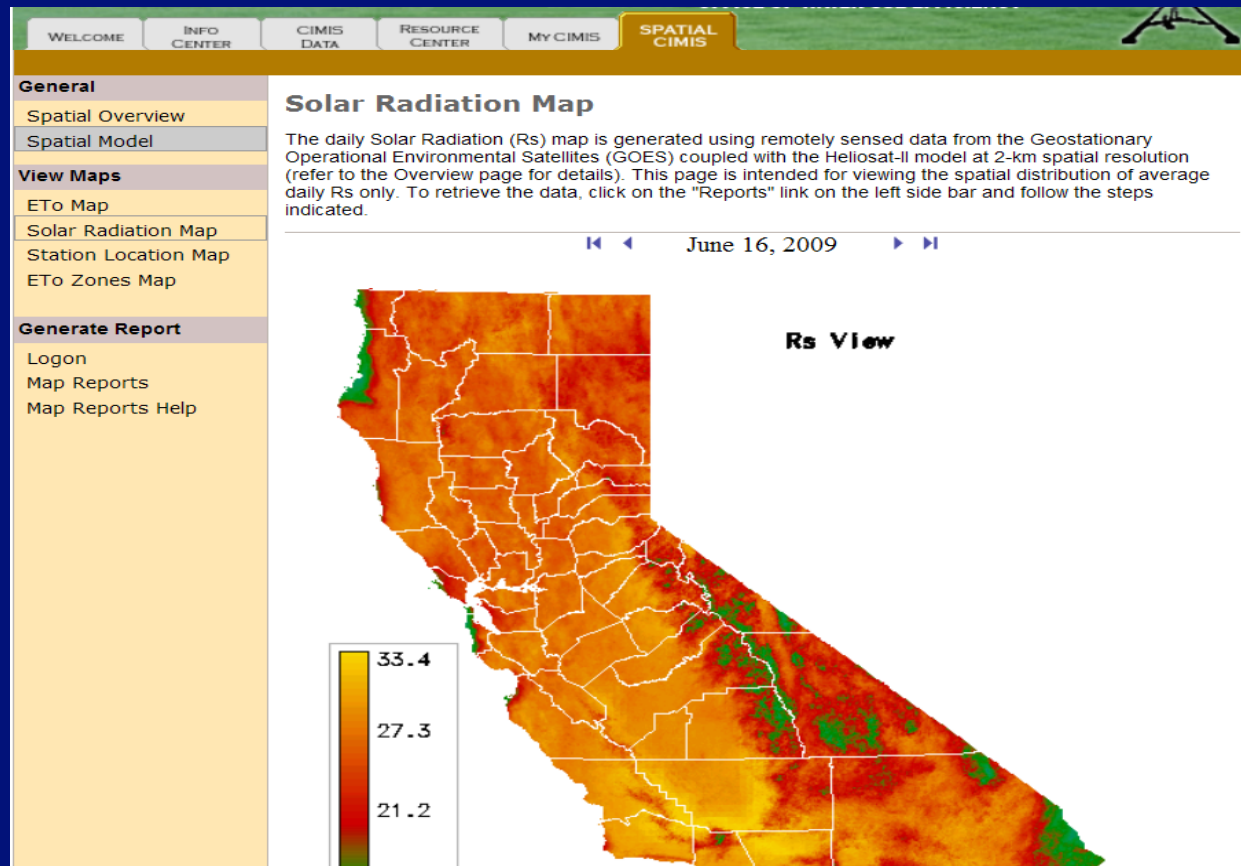

[Spatial Overview](#) The describes the needs for developing spatially distributed data and presents a brief outline of the processes involved.

[Spatial Model](#) The **Spatial Model** presents a brief description of the methodology used for

View Station Locations.

The screenshot displays the CIMIS (California Irrigation Management Information System) web application. At the top, the header includes the text "CALIFORNIA IRRIGATION MANAGEMENT INFORMATION SYSTEM", "DEPARTMENT OF WATER RESOURCES", and "OFFICE OF WATER USE EFFICIENCY". A navigation menu contains links for "WELCOME", "INFO CENTER", "CIMIS DATA", "RESOURCE CENTER", "MY CIMIS", and "SPATIAL CIMIS".

The left sidebar features a "General" section with "Station Location Map" selected. Below this are "View Maps" (ETO Map, Solar Radiation Map, Station Location Map, ETO Zones Map) and "Generate Report" (Logon, Map Reports, Map Reports Help).

The main content area is titled "Station Location Map" and includes a "Map" section with a descriptive paragraph: "The Station Location Map is created by overlaying geographic markers for each CIMIS station on top of Google maps. You can zoom in and out to see the exact station locations and you may also click the station marker for more detailed information." Below the text is a map of California with numerous numbered markers representing CIMIS stations. The map includes standard navigation controls (pan, zoom, map style selection) and a legend for "Map", "Satellite", and "Hybrid" views.

Map Reports

This report will provide reference evapotranspiration (ETo) and Solar Radiation (Rs) data reports at a 2km spatial resolution. Reports can be queried using a Google maps interface or by zip codes.

For brief descriptions of variations in zip code reports, renaming selected data points, and scheduling Email delivery, [Click Here](#). Please select your method below:

[Need Help?](#)

Query Type

Specify how you will designate points of interest. **Map Coordinates** allows you to select map-markers using point-and-click or the address search feature. **Zip Code(s)** allows you to specify from one to many zip codes.
