

Radiation Belt Analyses: needs, data and analysis

Hugh Evans

03/09/2017

Effects Requirements – What are we looking for?

- Dose (TID/TNID) ← total mission fluences (dose rate)
- Solar cell degradation: ← total mission fluences
- Internal charging ← peak daily/weekly/monthly fluences
- Single event effects:
 - long term (destructive): ← total mission fluence, probabilities
 - Short term (SEU, Transients): ← peak fluxes, probabilities
- Instrument background/noise:
 - Maximum noise levels: ← peak fluxes
 - Loss of "science" ← duration of "events"
← frequency of "events".
- Material Degradation ← total mission fluences
← low energies required (~ 10s keV)

Data Set Requirements

Detector information:

response functions, calibration data, thresholds...

Anisotropy in the environment?

→ Pitch angle or Look direction required

Count rate data, not just calibrated flux data -
for validation activities.

Cross Calibration with a “gold standard” instrument

Representative over the full dynamic range of the environment?

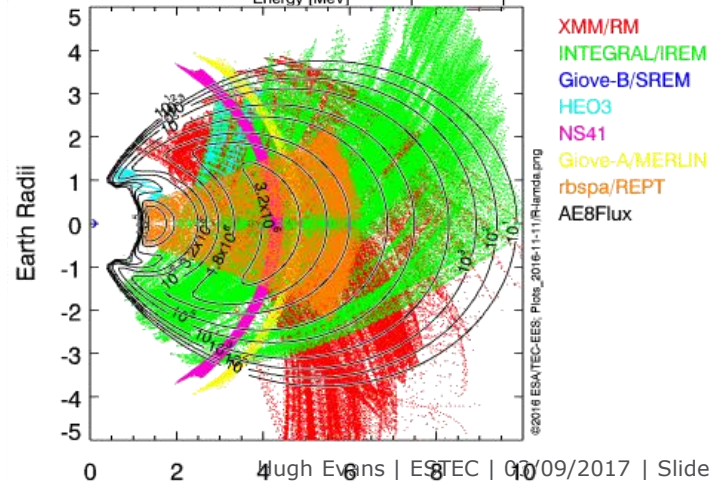

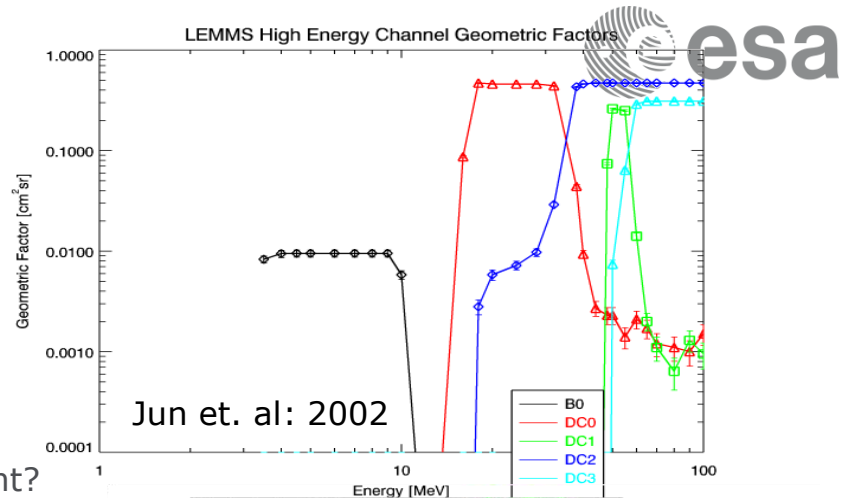

Full coverage of the magnetosphere??? Not really feasible...

AVAILABILITY??

Ideally automated downloads possible in a convenient data format. API for “favourite” analysis tool (Python, Matlab, IDL, Excel?)

Consistency

stability of data provision is greatly appreciated. Frequent (minor) updates of datasets makes consistent data analysis problematic.

Accessibility: ODI, an Unabashed Advertisement

Purpose: provide a single consistent interface to time series space environment data.

What is it: MySQL database housing the datasets, providing a set of access tools in Python, IDL, Matlab, Php, Excel...

See: <https://spitfire.estec.esa.int/trac/ODI>

```
e.g. Python odi = odiclient.new_instance()  
d = odi.get_dataset('ace_mfi_h0',  
START="2017-09-01", END="2017-09-15",  
LIMIT=10000)
```

Spitfire is a publicly available installation providing access to the following datasets:

https://spitfire.estec.esa.int/sedat/cgi-public/odi_datasets

A variety of dynamic plotting tools that use ODI as the backend are available via

<http://space-env.esa.int/index.php/NOAA-daily-plots.html>

Background Analysis

Cross Calibration

Protons can use solar particle events for cross calibration

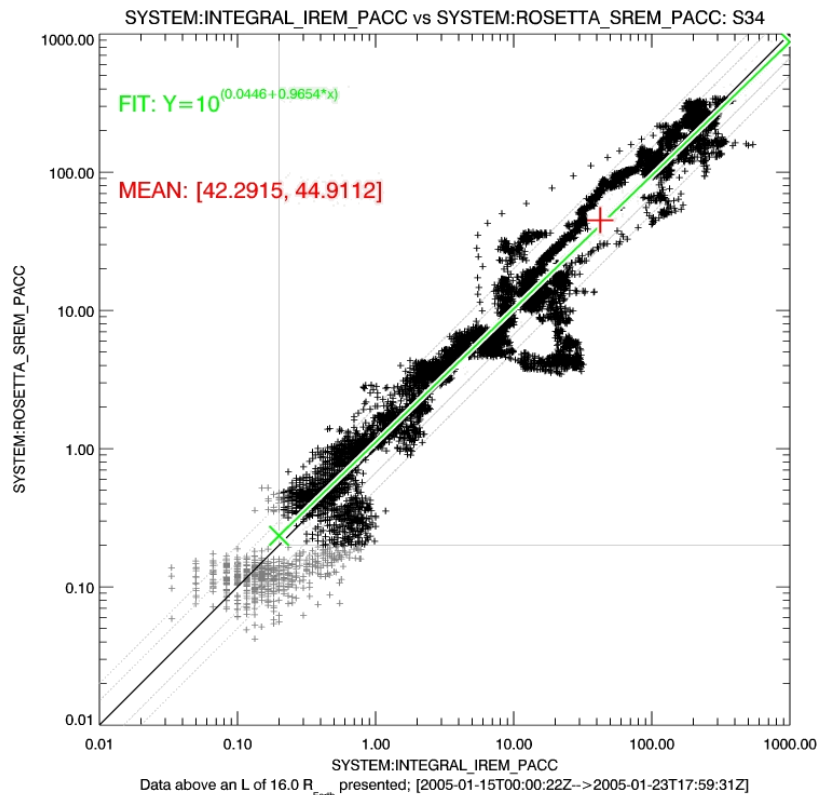

Electrons need to use spacecraft conjunctions:

- How close geographically/magneto-spherically is close enough?
- How close in time is close enough?
- Very Long term averages ?
- Quiet ($kp < 2$) time comparisons.

How well can we cross calibrate?

< 50%, 20%?? Impacts result reliability.

Gold standard! --- currently can use RBSP to calibrate to a baseline...but what of the future?

SEDAT@spitfire: hevans@scatterPit_2005.Jan_20140403153805

Cross Calibration

< 50%, 20%?? Impacts result reliability.

Gold standard! --- currently can use RBSP to calibrate to a baseline...but what of the future?

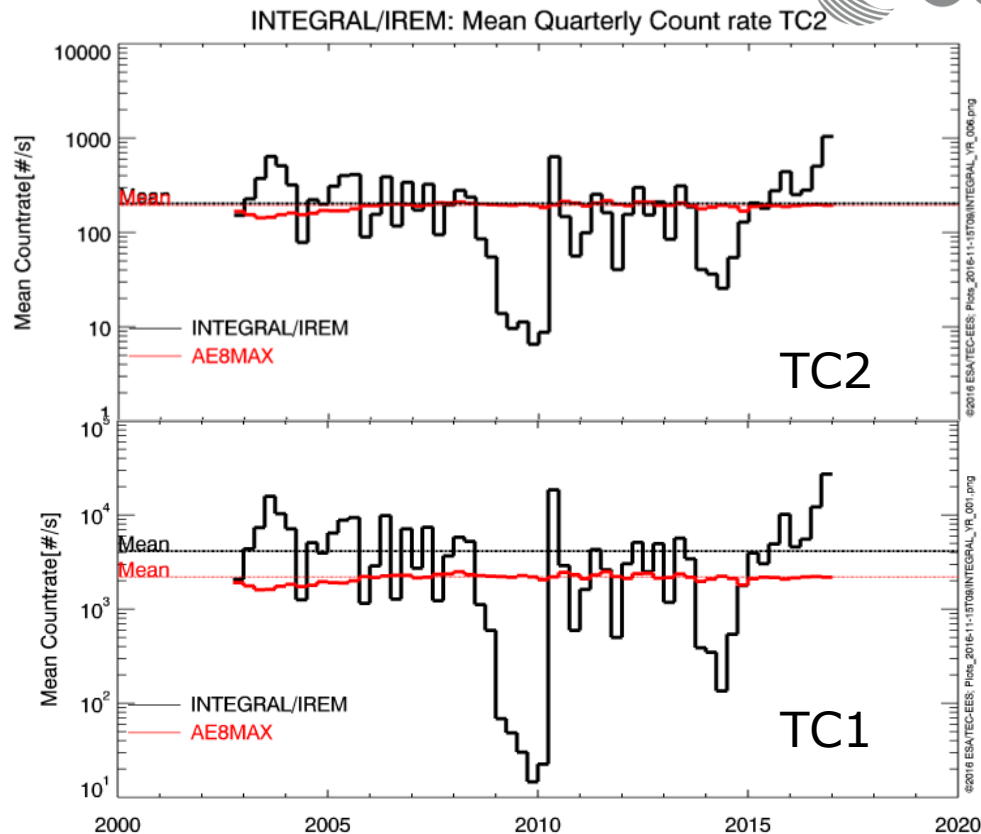

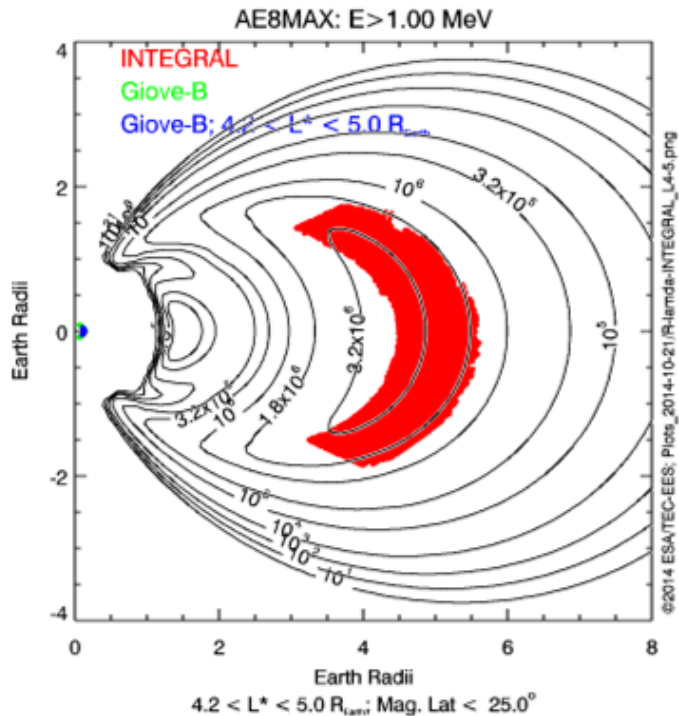

Environment Uncertainties Dataset Representativeness

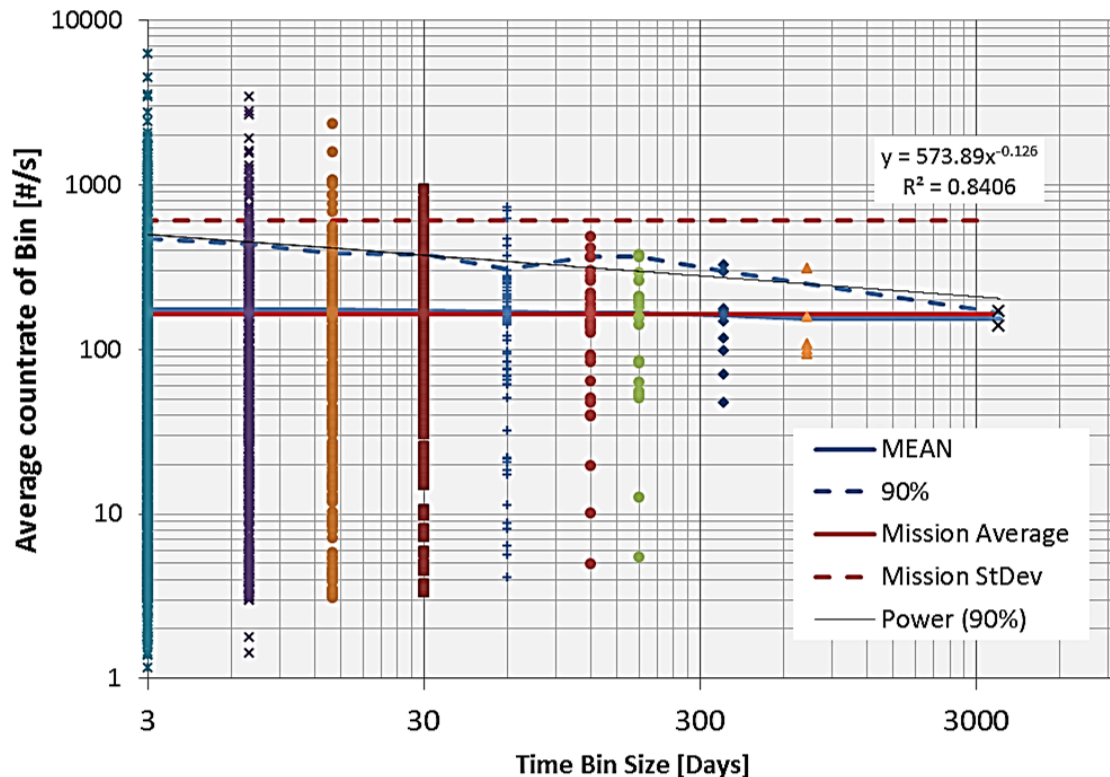

Integral Quarterly Mean Counts

$4.2 < L^* < 5.0$; $\lambda < 25^\circ$

Confidence levels and Duration

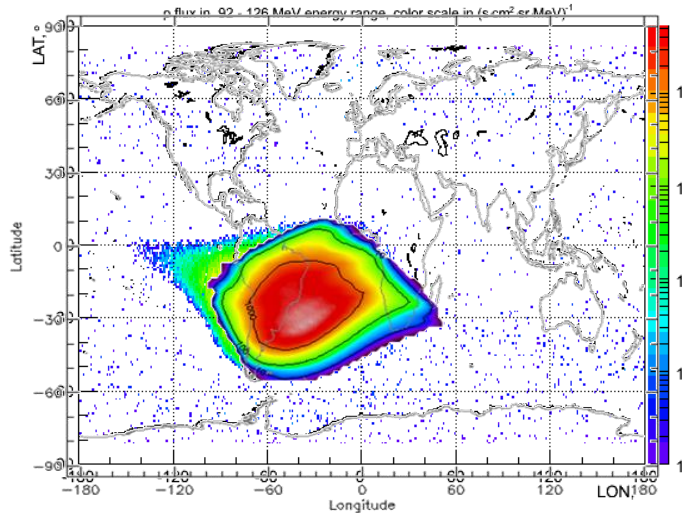

Integral/IREM TC1 data binned by time (L=6.6±0.25)

Tricky:
solar cycle and
seasonal variations
have to be
considered as well

Proba-V/EPT

92 MeV Protons

0.5 MeV electrons

Conclusions

Radiation belt analyses are only as good as the data that goes into them:

Well calibrated

Error in calibration and measurements known

no instrument saturation

Good particle species discrimination (no contamination)

Good energy discrimination

Representative of the long term Magnetospheric state

Anisotropies considered in the data and model

Full dynamics of the environment covered

Full coverage of the magnetosphere required
